APPENDIX A

CONCORDANCE TABLES

Baffinland

Concordance Table - Type A Water Licence 2AM -MRY1325			
Type A 2AM-MRY 1325		**2016 QIA and NWB Annual Report for Operations**	
Condition No.	**Condition**	**Report Reference/Response**	
Schedule B. General Conditions ***The Annual Report referred to in Part B, Item 4 shall include:***			
1	The Licensee shall file with the Board, no later than March 31st of the year following the calendar year being reported, an Annual Report on the appurtenant undertaking which shall contain the following information:	See below	Annual Report submitted on March 31, 2017.
a.	**WATER**		
i.	The monthly and annual volumes, in cubic meters, of all fresh Water withdrawn for domestic and industrial purposes and for dust suppression associated with the Early Revenue Phase, from each source in, on, or flowing through Inuit-owned land in accordance with Part E, Items 3, 4 and 25 of the License;	Section 2..0 Table 2.1 Table 2.2	Water Use and Waste Disposal Activities Daily, Monthly and Annual Quantities of Water Used for Project Sites on Inuit-Owned Land and Crown Land Daily and Annual Quantities of Water Used for Dust Suppression
ii	The monthly and annual volumes, in cubic meters, of all freshwater obtained for domestic and industrial purposes and for dust suppression associated with the Early Revenue Phase, from each source in, on, or flowing through Crown Lands in accordance with Part E, Items 3, 4 and 25 of the Licence;	Section 2..0 Table 2.1 Table 2.2	Water Use and Waste Disposal Activities Daily, Monthly and Annual Quantities of Water Used for Project Sites on Inuit-Owned Land and Crown Land Daily and Annual Quantities of Water Used for Dust Suppression
iii	The combined monthly and annual volumes in cubic meters of all fresh Water withdrawn for domestic and industrial purposes and for dust suppression associated with the Early Revenue Phase, from sources in, on, or flowing through both Inuit-Owned Land and Crown Lands	Section 2..0 Table 2.1 Table 2.2	Water Use and Waste Disposal Activities Daily, Monthly and Annual Quantities of Water Used for Project Sites on Inuit-Owned Land and Crown Land Daily and Annual Quantities of Water Used for Dust Suppression
iv	The monthly and annual volumes of reclaimed or recycled Water used and the purposes for which it is used;	Section 2.1.2 Table 2.2	Reclaimed and Recycled Water Daily and Annual Quantities of Water Used for Dust Suppression
b	**WASTE**		
i	The monthly and annual volume in cubic meters of treated Sewage effluent discharged from each Sewage Treatment Facility including each Polishing Waste Stabilization Pond;	Section 2.2.1 Table 2.5	Quantity of Treated Sewage Effluent and Sludge from WWTF and PWSPs Monthly and Annual Quantities of Treated Sewage Effluent and Sludge Removed
ii	The monthly and annual volume in cubic meters of treated wastewater discharged from each Oily Water/Wastewater Treatment Facility;	Section 2.2.2 Table 2.3	Quantity of Treated Wastewater from Oily Water Treatment Facility Monthly and Annual Quantities of Treated Oily Water Effluent
iii	The monthly and annual volume in cubic meters of any wastes backhauled to communities in Nunavut for treatment	Section 2.2.3 Table 2.4	Quantity of Effluent from Surface Water Management Ponds Monthly and Annual Quantities of Effluent Discharged from Ore and Waste Rock Stockpile Sedimentation Ponds
iv	The monthly and annual volumes in cubic metres of Sludge removed from each Sewage Treatment Facility and disposed of at each Landfill Facility or any approved alternative disposal facility	Table 2.5	Monthly and Annual Quantities of Treated Sewage Effluent and Sludge Removed
v	The monthly and annual volume in cubic meters of hazardous waste generated and transported from the Project sites to Licensed facility outside of Nunavut for treatment	Section 2.2.4 Appendix D.1 Appendix D.4	Solid Non-Hazardous and Hazardous Waste Management Waste Management Program 2016 Shipping Manifests (Inbound and Outbound)
vi	The monthly and annual volume in cubic meters of any wastes backhauled to communities in Nunavut for treatment	N/A	No wastes were backhauled to communities in Nunavut for treatment in 2016.

Concordance Table - Commercial Lease No. Q13C301			
Commercial Lease No. Q13C301		**The 2015 QIA and NWB Annual Report**	
Condition No.	**Condition**	**Report Reference**	
Annual Reporting Requirements			
Part 6.4	For informational purposes, by no later than March 31 in each Year during the Term, the Tenant shall deliver to the Landlord an Annual Report for the preceding Year which shall include the following:	See below	Annual Report submitted on March 31, 2017.
a.	A report of activities conducted relative to what was described in the Work Plan submission for the Previous Year;	Section 1.1 Section 7.3	Summary of Project Activities for 2016 Summary of Construction Activities
b.	A description of construction and infrastructure changes, additions or removals located within the boundaries of all Land Use Areas;	Section 1.1 Section 4.0 Section 7.3 Appendix C.1 Appendix C.3	Summary of Project Activities for 2016 Modifications Summary of Construction Activities Construction Summary Reports Photo Journal
c.	All "As Built" reports available, signed and stamped by an Engineer, for all works completed as per (b) above;	Appendix C.1	Construction Summary Reports
d.	Description of any and all mining and exploration activities, and the results and outcomes thereof including:	Section 1.1	Summary of Project Activities for 2016 (see sections below)
	I. exploration activity and drilling summary	N/A	Refer to *2016 QIA and NWB Annual Report for Exploration and Geotechnical Drilling Activities* submitted to QIA and NWB on March 31, 2017.
	II. amount and type of ore and waste mined in each month	Table 2.9 Table 9.1	Monthly and Annual Quantities of Waste Rock Generated and Used or Disposed of Monthly and Annual Quantities of Ore Generated by the Project
	III. amount and type of ore shipped each month	Table 9.2	Monthly and Annual Quantities of Ore Shipped by the Project
	IV. quantities of each Specified Substance including sand, gravel, construction stone, and ice, quarried each month, broken down by individual quarry site or borrow location	Table 7.1 Table 7.2	Quarterly and Annual Quantities of Specified Substances Removed from Borrow and Quarries (BCMs) Quantities of Specified Substances Removed from Borrows and Quarries (BCMs) for September 1, 2015 to August 31, 2016 Reporting Period
e.	Quantities of waste deposited in the landfill, landfarm and or other approved waste storage areas each calendar quarter	Section 2.2.4 Table 2.6 Table 2.7 Table 2.8	Solid Non-Hazardous and Hazardous Waste Management Location of Temporary and Permanent Storage Areas for Wastes Monthly and Annual Quantities of Waste Disposed in Non-Hazardous Landfill Facility Monthly and Annual Quantities of Hydrocarbon Impacted Soil, Water and Snow Disposed of at Landfarm Facility
f.	Type and quantities of materials the were shipped off the Lands	Section 6.1 Appendix D.1 Appendix D.4	Progressive Reclamation Waste Management Program 2016 Shipping Manifest (Inbound and Outbound)
g.	Type and quantities of materials that were shipped to and stored on the Lands	Section 1.1 Appendix D.4	Summary of Project Activities for 2016 Shipping Manifests (Inbound and Outbound)
h.	A detailed description of any and all Reclamation Work on the Property	Section 6.1 Appendix C.3 Appendix D.1 Appendix D.4	Progressive Reclamation Photo Journal Waste Management Program 2016 Shipping Manifests (Inbound and Outbound)

Baffinland

Concordance Table - Commercial Lease No. Q13C301			
Commercial Lease No. Q13C301		**The 2015 QIA and NWB Annual Report**	
Condition No.	**Condition**	**Report Reference**	
i.	Any and all information related to a finding of non-compliance or breach of environmental standards as discovered by any Governmental Authority	Section 7.6 Appendix D.7	Inspection and Compliance Reports Inspection Reports and Follow-Up Reports
j.	A listing and compilations of reports associated with any accident, spill, release of hazardous material in the environment, fire, emergency or loss of life	Section 3.0 Table 3.1	Spills Summary of Unauthorized Discharges
k.	Information respecting the Tenant's compliance with the terms of this Lease and any permits or licenses required in respect of its Operations on the Property, together with details of any incidents of non-compliance, the results of any inspection reports or orders prepared or issued by or fines levied by any competent regulatory authority and any remedial action relating thereto	Section 7.6 Appendix D.7	Inspection and Compliance Reports Inspection Reports and Follow-Up Reports

APPENDIX B

NWB ANNUAL REPORT FORMS

NWB Annual Report **Year being reported:** 2016

License No:	2AM-MRY1325 - Amend. No 1	**Issued Date:**	July 21, 2015
		Expiry Date:	June 10, 2025

Project Name: Mary River Project

Licensee: Baffinland Iron Mines

Mailing Address: 2275 Upper Middle Road East, Suite 300
Oakville ON, Canada L6H 0C3

Name of Company filing Annual Report (if different from Name of Licensee please clarify relationship between the two entities, if applicable):

Baffinland Iron Mines Corporation

General Background Information on the Project (*optional):

Refer to Section 1.0 of the 2016 QIA and NWB Annual Report for Operations

Licence Requirements: the licensee must provide the following information in accordance with

Part B | Select

A summary report of water use and waste disposal activities, including, but not limited to: methods of obtaining water; sewage and greywater management; drill waste management; solid and hazardous waste management.

Water Source(s): Refer to Section 2 and Figure 1.3 and 1.5

Water Quantity:		
	220,752 cu.m/year	Quantity Allowable Domestic (cu.m)
	Various - Refer to Table 2.1 and Table 2.2 of the Report	Actual Quantity Used Domestic (cu.m)
	-	Quantity Allowable Drilling (cu.m)
	-	Total Quantity Used Drilling (cu.m)

Waste Management and/or Disposal

- [x] Solid Waste Disposal
- [x] Sewage
- [x] Drill Waste
- [x] Greywater
- [x] Hazardous
- [ ] Other:

Additional Details:

Refer to Section 2 of the 2016 QIA and NWB Annual Report for Operations

A list of unauthorized discharges and a summary of follow-up actions taken.

Spill No.: See Table 3.1 (as reported to the Spill Hot-line)
Date of Spill: See Table 3.1
Date of Notification to an Inspector: See Table 3.1
Additional Details: (impacts to water, mitigation measures, short/long term monitoring, etc.)

See Table 3.1, Section 3 and Appendix D.7.4 of the 2016 QIA and NWB Annual Report for Operations

Revisions to the Spill Contingency Plan

Other: (see additional details)

Additional Details:

Refer to updated Emergency Response Plan and Spill Contingency Plan

Revisions to the Abandonment and Restoration Plan

AR plan submitted and approved - no revision required or proposed

Additional Details:

Progressive Reclamation Work Undertaken

Additional Details (i.e., work completed and future works proposed)

Refer to Section 6.1 of the 2016 QIA and NWB Annual Report for Operations

Results of the Monitoring Program including:

The GPS Co-ordinates (in degrees, minutes and seconds of latitude and longitude) of each location where sources of water are utilized;

Details described below

Additional Details:

Refer to Table 5.1 and Figures 1.3 to 1.7 (inclusive) of 2016 QIA and NWB Annual Report for Operations

The GPS Co-ordinates (in degrees, minutes and seconds of latitude and longitude) of each location where wastes associated with the licence are deposited;

Details described below

Additional Details:

Refer to Table 2.6 and Figures 1.3 to 1.7 (inclusive) of 2016 QIA and NWB Annual Report for Operations

Results of any additional sampling and/or analysis that was requested by an Inspector

No additional sampling requested by an Inspector or the Board

Additional Details: (date of request, analysis of results, data attached, etc.)

Any other details on water use or waste disposal requested by the Board by November 1 of the year being reported.

Select

Additional Details: (Attached or provided below)

Any responses or follow-up actions on inspection/compliance reports

Select

Additional Details: (Dates of Report, Follow-up by the Licensee)

Refer to Section 7.6 and Appendix D.7 of the 2016 QIA and NWB Annual Report for Operations

Any additional comments or information for the Board to consider

The 2016 QIA and NWB Annual Report for Operations provides further details on water use and waste disposal, construction activities, geochemical analysis of core, fuel storage, unauthorized discharges, inspection and compliance report concerns, updates to plans, progressive reclamation work and consultations.

Date Submitted: March 31, 2017

Table of Contents

List of Tables

List of Figures

Appendices

1. Facility Description

1.1 Purpose and Design Basis

The Mine Site waste rock sedimentation pond retains runoff water from the waste rock stockpile and allows solids suspended in the water to settle. Each summer a portable pump will be set up at the pond, and following water testing to confirm the water satisfies the discharge criteria, the water will be pumped over the pond wall in to a ditch. The ditch is 1.25km long and directs the water to a natural stream system that is non-fish bearing. The non-fish bearing stream eventually discharges to Mary River.

The pond is sized to hold water generated from the waste rock stockpile area under normal operations, based on an annual pond pump out after the freshet. The diversion ditch will receive water flows during normal pump discharge and also if the pond overflows due to exceedance of its available storage capacity.

The as built storage capacity for the empty pond is 9,200m^3 based on information provided by the Civil contractor.

1.2 Location and Base Elevations

The waste rock sedimentation pond is located between Northing N 7 916 650 and N 7 916 850, and Easting E 562 800 and E 563 200. The pond bottom elevation varies between EL. 573m and 576m. The berm top elevation is at EL. 577m.

The waste rock pond overflow ditch is located between Northing N 7916 800 and N 7 917 200, and Easting E 562 800 and E 563 800. The elevation at the bottom of the ditch varies between EL. 576.2m and 568m.

1.3 Geometry and Access

The pond is constructed with a curved berm with design side slopes not steeper than 3H:1V and the berm top width is 8.4m. The overflow weir design slopes are 5H:1V exiting the pond.

1.4 Earthworks Materials Details

The ponds bottom is built up above the elevation of the original ground and the berm is constructed with raised earthworks. The pond has been sealed with exposed HDPE liner material for storage of the runoff water and sediments.

2. Construction Activity Summary

Construction activities on the Mine Site Waste Rock Sedimentation Pond and Drainage Ditch started in September 2015 and carried on through to August 2016. Installation of the pond liner took place in May 2016.

The following summarizes the construction activities for the pond:

a. Construct berm

b. Clear original ground inside berm

c. Excavate key ditches

d. Place crushed rock over original ground inside berm

e. Install non-woven geotextile layer

f. Install HDPE geo-membrane liner

g. Backfill key trenches

h. Place riprap

The following summarizes the construction activities for the ditch:

a. Excavate trench

b. Place rip rap

QA/QC

The quality assurance and quality control (QA/QC) conducted by Layfield documents the preparation of the subgrade, installation and final inspection of the completed liner (Appendix A).

a. An inspection of the soil subgrade was conducted prior to installation of geo-membrane and a Certificate of Acceptance of Soil Subgrade Surface was signed by the project coordinator and Layfield Environmental supervisor.

b. Daily Installation Reports prepared by Layfield describe the work performed, labour on site and weather conditions each day.

c. A certificate of final inspection and acceptance was signed by Layfield and the Baffinland project coordinator.

4. As-Built Drawings

The as-built drawings incorporate contractor provided and satellite survey data and contractor supplied field sketches. The as-built drawings are attached in Appendix B.

Table 4-1: Waste Rock Sedimentation Pond and Drainage Ditch As-Built Drawing List

Drawing Number	Title	Revision
H349000-4230-10-035-0001	Mine Site Waste Rock Sedimentation Pond Earthworks & Drainage – Plan	1
H349000-4230-10-035-0002	Mine Site Waste Rock Sedimentation Pond Earthworks & Drainage – Sections	1
H349000-4230-10-035-0003	Mine Site Waste Rock Drainage – Diversion Ditch Plan and Profile	0

5. Field Decisions

The following section describes field decisions made during construction:

- In some areas the design slope of 2:1 on the ditch walls was found to be too steep for the original ground material and the walls were collapsing during construction. A field decision was made to increase the slope up to 3:1 to achieve a stable ditch wall.
- The drainage slope of the ditch was reduced in the field due to differences in design topography data and that found in the field. As a result of this slope reduction the original ground was built up in some areas to achieve the bottom of ditch elevation. Ditch walls were built up from the elevation of the raised ditch bottom.
- In August 2017, after construction of the pond and ditch was completed, three additional ditches were dug upstream of the pond to direct water in to the pond, one in the centre of the pond and one at each end.

6. Performance Evaluation

The following issues have occurred with performance of the pond and ditch after completion of construction.

- The perimeter key that is designed to retain the pond liner on the upstream side of the pond collapsed due to poor ground conditions. As a result of this collapse, the liner lifted and allowed water under the liner. To remediate this issue, the liner was cut back and re-buried.
- There is a concern that water may be migrating underneath the liner in one location. Baffinland's Environmental Department is investigating this issue.

7. Vibration Monitoring and Quarrying Activity

No vibration monitoring was conducted during the construction of the Mine Site Waste Rock Sedimentation Pond and Drainage Ditch as it was not deemed necessary based on the scope of activities required for construction.

Control for quarrying activity was conducted as per the project's specific management plans:

- BAF-PH1-830-P16-0040 (H349000-4100-07-245-0001): Quarry Management Plan Mine Site Quarry (QMR2).
- BAF-PH1-830-P16-0004 (H349000-1000-07-126-0011): Borrow Pit and Quarry Management Plan

8. Environmental Monitoring

Environmental monitoring during the construction of the Mine Site Waste Rock Sedimentation Pond and Drainage Ditch was conducted as per the Environmental Protection Plan (EPP), Baffinland document number BAF-PH1-830-P16-0008.

In addition to the EPP, construction follows the requirements of the Environmental Health and Safety Management Framework, Baffinland document number BAF-PH1-830-STD-0001. The Baffinland on-site Environmental Management Team was responsible for environmental monitoring at all sites during construction and following-up with the construction team(s) if there were any reported environmental incidents or non-conformances.

Mine Site Waste Rock Sedimentation Pond and Drainage Ditch construction was also required to follow the requirements of the Surface Water and Aquatic Ecosystems Management Plan, BAF-PH1-830-P16-0026. This Management Plan outlines the best management practices implemented to limit the potential for adverse impacts to receiving waters, aquatic ecosystems, fish and fish habitat used during construction. In addition this plan details the systems in place to mitigate and manage drainage and runoff at the building sites, address point and non-point discharges to surface waters and assess those discharges on water quality and quantity relative to their receiving water systems.

The Spill Contingency Plan, BAF-PH1-830-P16-0036, in conjunction with the Emergency Response Plan, BAF-PH1-830-P16-0007, provides guidance and instructions for first responders and Baffinland Management in the event of a spill event or other emergency such as fire or accident.

The risks to the water quality in the respective rivers and streams as a result of construction of the Mine Site Waste Rock Sedimentation Pond and Drainage Ditch would originate from the following sources based on construction methodology:

- Spills from equipment
- Increase in sediment load in the water

There were no recorded spills from equipment used at the construction site. During the period of construction, water quality monitoring conducted at downstream stations under Part D, Section 16 and Part I, of the Type “A” Water Licence 2AM-MRY1325 indicated total suspended solids (TSS) and other parameter at levels below the specified Water License criteria. The results for water quality monitoring were provided in monthly reports submitted to the Nunavut Water Board and other stakeholders. In consideration of the above, the environmental mitigation strategies were effective in maintaining runoff water quality.

9. Earthworks Data

The survey data collected has been included in Appendix C.

10. Unanticipated Observations

The following unanticipated observations were made during construction of the pond and ditch.

- Surface topography in the ditch construction area did not match the Lidar survey data used to design the ditch alignment.
- A large snow bank remained in the ditch construction area and prevented a field check of the existing survey data prior to construction starting.
- The water table was located at the surface in the ditch construction area.
- The natural ground conditions are very poor. During the summer construction periods the existing ground turned to deep mud.
- Ditch side walls were collapsing during construction due to the poor ground conditions and high water table.
- Upon excavation of the existing ground, no permafrost was evident.
- A snowstorm in September 2016 prevented collection of final survey data. Data used to As Build the drawings is based on satellite survey data collected in August 2016.
- The liner key on the high side of the pond perimeter is built in to the original ground. During the 2016 summer, the liner key collapsed as a result of the poor ground conditions. To repair the pond, the liner was cut back and re-buried.
- In the summer 2015 construction period, the bottom of the ditch between 0+100 and 0+325 was over excavated and back filled. During the 2016 summer construction period, the back fill in this area became unstable and had to be removed and replaced with waste rock.

11. Surface Monitoring

Not conducted.

12. Required Maintenance

The following maintenance will be required for the pond and ditch.

- During construction of the ditch, the project ran out of rip rap, so one 125m long section of the ditch does not have rip rap installed. Rip rap will be installed in this section in 2017.
- An annual inspection and maintenance program for the ditch is recommended. The high volume of ground water and the poor quality of the original ground may result in movement of placed rip rap in to the original ground. The 50m section of ditch closest to the discharge point is of particular concern.

13. Adaptive Management

For discussion of adaptive management principles and practices applied during the Construction Phase of the Project and their overall effectiveness please refer to the 2015 Annual Report to the Nunavut Impact Review Board. Any additional adaptive management practices implemented as a result of works completed in 2016 will be reported in the updated 2016 Annual Report to the Nunavut Impact Review Board.

14. Concordance with Type “A” Water Licence

The Nunavut Water Board Type “A” Licence 2AM-MRY1325, Schedule D, outlines the requirements for Construction Monitoring Reports. The following table provides a concordance of the report, herein, with the requirements included in Part D.

Table 14-1: Table of Concordance for Schedule D

Schedule D Item No.	Schedule D Description	Corresponding Section in this Report
1a	description of all infrastructure and facilities designed and constructed to contain, withhold, divert or retain Water and/or Waste;	1
1b	a summary of construction activities including photographic records before, during and after construction of the facilities and infrastructure designed to contain, withhold, divert or retain Water and/or Waste;	2, 3
1c	as-built drawings and design for facilities and infrastructure, in Item 1(a) of this schedule, designed and constructed to contain, withhold, divert or retain Water and/or Waste;	4
1d	documentation of field decisions that deviate from the original plans and any data used to support or developed facilities and infrastructure to withhold, divert or retain Water and/or Waste;	5
1e	a comparison of measured versus predicted performance of infrastructure and facilities;	6
1f	any blast vibration monitoring and control for quarrying activity carried out in close proximity to fish bearing waters;	7
1g	monitoring conducted for sediment and explosives residue release from construction areas;	8
1h	monitoring undertaken in accordance with Part D of the during the Construction Phase of the Project;	8
1i	details confirming that the requirements of the CCME guidance document entitled “Aboveground Storage Tank Systems for Petroleum and Allied Petroleum Products (2003)” have been met by the Licensee;	N/A
1j	data collected from instrumentation used to monitor earthworks and the interpretation of that data;	9
1k	a discussion of any unanticipated observations including changes in risk and mitigation measures implemented to reduce risk during construction;	10
1l	an overview of any method including frequency used to monitor deformations, seepage and geothermal responses;	11
1m	a summary of maintenance work undertaken as a result of settlement or deformation of dikes and dams;	12
1n	a summary of adaptive management principles and practices applied during the relevant phases of the Project and their overall effectiveness.	13

Appendix A

Liner Data

LAYFIELD

CERTIFICATE OF ACCEPTANCE OF SOIL SUBGRADE SURFACE

PROJECT NAME: Baffinland waste Rock Pond.
PROJECT NUMBER: Ct CCCO 71
OWNER: BIM
LOCATION: MaryRiver

I, the undersigned, a duly appointed representative of Layfield Environmental Systems Ltd. (LESL), have visually observed the soil subgrade described below, and found it to be an acceptable surface on which to install geomembrane.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield Environmental Systems, and LESL makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield Environmental Systems accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade accepted on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield Environmental Systems and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

Area Being Accepted: Waste Rock pond - 3/4 crush minor imperfections due to frozen ground, Area was Inspected and fixed as install took place 12,550 Sqm

LAYFIELD

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Baffinland Waste Rock Pond.
PROJECT NUMBER: CT-000071 **DATE:** May/08/2016
OWNER: BIM
LOCATION: Mary River

SCOPE OF INSTALLATION(S): THE WORK
Installation of LP7 on 3/4" crush and 12,550 Sq M of 6060 Geomembrane. Installed tested and completed.
Gross material used 13,208 Sq M
Net used 12,550
Calculated waste 5%

Part 1 – LAYFIELD ENVIRONMENTAL SYSTEMS LTD.

I, Mathew Bourne, a duly appointed representative of Layfield Environmental Systems Ltd. (LESL), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield Environmental Systems' QC program and the terms and conditions of the contract.

Layfield Environmental Systems Representative:
Name: Mathew Bourne
Title: Supervisor
Date: May/08/2016 Signature: Mathew Bourne.

Part 2 – OWNER (or Representative)

I, Dave McCann, a duly appointed representative of Baffinland Iron Mines, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield Environmental Systems representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Daily Installation Report

(revised Feb/08)

Supervisor : Mathew Bourne

Date : May/06/206

Customer & Project Title : Baffinland Waste Rock pond

Job Number : Ct cccc71

Weather : Overcast (*morning*) Sun/clouds (*noon*) (*night*)

Description of Work Performed

Started are day at 6:00
Had meeting
Traveled to pond
Completed ToolBox/FLRA
Began laying textile
Deployed Panels
Took lunch
continued deployment
Preped Tie-in
welded Tested Area
Bagged down liner cleaned up and headed to camp

BAFFINLAND IRON MINES CORPORATION
MARY RIVER PROJECT

Mine Haul Road
Drainage Improvement Project
Phase 1 Construction
As-Built Report

Submitted to:
Baffinland Iron Mines Corporation
2275 Upper Middle Road East, Suite 300
Oakville, ON Canada
L6H 0C3

REPORT

Report Number: 1649295 (DOC008)

Distribution:

1 electronic copy - Baffinland Iron Mines Corporation
1 hardcopy- Golder Associates Ltd.

Golder Associates

Executive Summary

Golder Associates Ltd. (Golder) was retained by Baffinland Iron Mines Corporation (Baffinland) to provide engineering design and offsite technical support for the Phase 1 (pre-freshet 2016) construction activities related to the Mine Haul Road Drainage Improvement Project. Construction drawings and specifications were included in the design report summarizing the Mine Haul Road Drainage Improvement Project prepared for Baffinland by Golder (2016a). A key recognition for the overall project was that a phased approached for construction was required as it was not feasible to construct the entire works in a single period.

The Phase 1 scope of work included installation of seven twin culverts and inspection of the existing ditch and improving the ditch (as required) to meet the design requirements of cross-sectional area and erosion protection. It was recognized at the time of the design that the scope of work for Phase 1 construction may not be carried in completion due to weather constraints. Incomplete work (or partially completed) in Phase 1 was to be deferred to Phase 2 construction.

Phase 1 construction was carried out between April 25, 2016 and May 15, 2016. Baffinland and OPC North provided construction management and contract administration for the duration of the work. Nuna Logistics Ltd. was the main contractor responsible for the completion of the scope of work, quality control, and surveying. Hatch Ltd. provided quality assurance and Golder provided offsite engineering support during this period.

Six twin culverts and one single culvert were installed and the existing ditch was protected with rip along the mine haul road. The culvert trench was excavated by drilling and blasting due to the frozen ground conditions. The existing ditches were cleared of snow and inspected. Due to the time constraints and weather conditions the existing ditches were not modified. The existing ditches were observed to have little to no erosion protection. Rip rap was added along the length of the ditch, and in steep sections geotextile was placed prior to rip rap.

The following modifications were made to the design during construction:

- The culverts layout points were adjusted to fit the encountered field conditions.
- Only one culvert was installed at the CV2 culvert crossing location.
- Culverts inlet basins were configured to fit encountered field conditions.
- Downstream outflow pads were constructed without excavation to create a toe depression.
- The existing ditch was not modified to achieve the design dimensions.
- Ditch 7 and Ramps 1, 2, and 3 ditches were not constructed.
- An additional culvert (CV8) was installed in the magazine access road.

These modifications were made to accommodate field conditions and timing constraints. The modifications were made in discussion with Golder and are considered to have no material effect on the completed work relative to the design. Alterations and maintenance may be required in the future to accommodate these modifications.

The outstanding items from Phase 1 construction plus the additional requirements in Phase 2 construction are provided below:

- A post-construction inspection by a member of Golder's engineering team is to be carried out.
- Sections of the ditch should be modified to meet the design requirements if performance and/or observations indicate such.
- Ongoing inspection and maintenance of the rip rap is to be carried out as the rip rap rock sizes used in the ditch and culvert inlet basins and outflow pads are insufficient for the design storm as described in the design report (Golder 2016a).
- Develop and implement an inspection and maintenance program as per the design (Golder 2016a).
- Connect the downstream outflow pad to a stream/ flow path with sufficient protection to convey the design storm as per the design (Golder 2016a).
- Implement improvements to the mine haul road to reduce sediment loading (Golder 2016b).

The Phase 1 construction campaign was completed in substantial compliance with the design intent based on Golder's review of the information provided by Baffinland. Field changes that were made to suit the field conditions encountered.

The Reader is instructed to read the entire report, including appendices. Particular attention is to be paid to the *Study Limitations* section following the report text.

Table of Contents

1.0 INTRODUCTION

Golder Associates Ltd. (Golder) was retained by Baffinland Iron Mines Corporation (Baffinland) to provide engineering design and offsite technical support for the Phase 1 (pre-freshet 2016) construction activities related to the Mine Haul Road Drainage Improvement Project.

Baffinland owns and operates the Mary River Project, an open pit iron ore mine located on northern Baffin Island, in the Nunavut Territory at a latitude of 71°19' north and a longitude of 79°12' west. Operations comprise the blasting and excavation of ore and waste rock. Waste rock is managed in stockpiles. Ore is hauled from the open pit via the mine haul road to the crushing area. Following crushing, the ore is loaded onto trucks and hauled to the port facility for shipment to processing facilities. There are no processing facilities on-site.

Golder completed a site visit in February 2016 and carried out an options assessment for improving the water management system with Baffinland. Baffinland developed a Mine Haul Road Drainage Improvement Project which included modifications to the road side ditch and to the road culvert crossings in addition to the placement of additional mine haul road embankment fill as the preferred option. Golder prepared a design report summarizing the Mine Haul Road Drainage Improvement Project, including construction drawings and specifications (Golder 2016a). A key recognition for the overall project was that a phased approached for construction was required as it was not feasible to construct the entire works in a single period. Phase 1 construction was carried out between April 25, 2016 and May 15, 2016. This report summarizes the construction activities that took place as part of the Phase 1 construction campaign for the Mine Haul Road Drainage Improvement Project. Golder provided offsite engineering support during the Phase 1 construction.

The report is organized as follows:

- The original scope of work is described in Section 2;
- The division of responsibilities for the construction campaign is provided in Section 3;
- A summary of the as-built information provided by Baffinland for inclusion in this report is provided in Section 4;
- The modifications and scope revisions are provided in Section 5;
- The construction activities are described in Section 6;
- The construction quality control and quality assurance are described in Section 7; and
- The path forward is described in Section 8.

The Reader is instructed to read the entire report, including appendices. Particular attention is to be paid to the *Study Limitations* section following the report text.

2.0 PHASE 1 SCOPE OF WORK

Phase 1 construction of the mine haul road drainage improvement project was to be carried out prior to the 2016 spring freshet. The phase 1 scope of work included the following:

- Installation of seven twin culverts, including the construction of the culvert inlet basin and downstream outflow pad.
- Inspection of the existing ditch and improving the ditch (as required) to meet the design requirements of cross-sectional area and erosion protection.

It was recognized at the time of the design that the scope of work for Phase 1 construction may not be carried to completion due to weather constraints. Incomplete work (or partially completed) in Phase 1 was to be deferred to Phase 2 construction. Additionally, the drainage swale from approximately station 103+750 to 105+250 (if required) and the sediment traps (if required) within the ditch along the mine haul road would be carried out in Phase 2 construction if determined to be required based on conditions encountered in the field.

Golder is to perform a post-freshet 2016 inspection of the Phase 1 construction. As of the date of this report, this inspection had yet to be carried out but is expected to be scheduled.

3.0 DIVISION OF RESPONSIBILITIES

The division of responsibilities for the parties involved were as follows:

Baffinland

Role: Owner
Responsibilities: Construction management, contract administration

OPC North

Role: Owner's Representative
Responsibilities: Construction management, contract administration

Nuna Logistics Ltd.

Role: Contractor
Responsibilities: Completion of the scope of work, construction quality control, layout, and as-built surveying

Hatch Ltd.

Role: Owner's Representative (assisting OPC North)
Responsibilities: Quality assurance

Golder

Role: Designer and engineering support
Responsibilities: Technical support on an as requested basis, preparation of as-built report and drawings.

4.0 AS-BUILT INFORMATION PROVIDED BY BAFFINLAND

The following information was provided by Baffinland for inclusion in the as-built report:

- As-built surveys of the constructed culverts and ditch. These files were used to produce as-built drawings in Appendix A and a copy of the raw files is provided in Appendix B.

- Quality control and quality assurance construction checklists and photographs (Appendix C)

No material grain size analyses on the construction materials were carried out. No survey data of the trench backfill grades or downstream outflow pads were provided. Because the existing haul road survey data used in the design did not match the encountered field conditions, some additional survey data of the road shoulders was collected during construction and is presented in the as-built drawings.

5.0 MODIFICATIONS AND SCOPE REVISIONS

Modifications to the design provided in the construction drawings and specifications were required to accommodate field conditions that were encountered as construction progressed. The project scope of work was occasionally revised for similar reasons. The following modifications were made:

- The culverts layout points were adjusted to fit the encountered field conditions. The base mapping contour data used in the design did not match the encountered field conditions and as such the layout points of the culverts, culvert inlet basins and downstream outflow pads were adjusted. The culvert crossing locations were moved slightly to the best fit the existing conditions while maintaining the design requirements.
- Only 1 culvert was installed at the CV2 culvert crossing location. The required flow capacity is provided by this single culvert but the redundancy of twin culverts is not provided.
- Culverts inlet basins were configured to fit encountered field conditions. The width, depth, and side slopes varies at each inlet location and differs from the design configuration. A minimum depth of 0.6 m below the below the culvert to the base of the inlet basin was not obtained at some crossing locations. The inlet basins that were constructed smaller and with steeper side slopes than design requirements will still function as required however increased maintenance will be required. Where a minimum depth of 0.6 m was not achieved, there is a higher risk of sediment transportation downstream.
- Downstream outflow pads were constructed without excavation to create a toe depression. Instead of excavating the downstream slope, geotextile and rip rap were placed on the existing slope. The purpose of the toe depression was to dissipate energy to avoid erosion of the downstream slope. Improvements to the downstream outflow pad may be required.
- The existing ditch was not modified to achieve the design dimensions. Due to the timing of the construction period and the onset of the 2016 freshet, alterations to the ditch configuration were postponed. The existing ditch varies in depth, width and side slopes throughout the length. The existing ditch was protected with rip rap and due to the varying configuration the thickness of the rip rap varies throughout the length. Sections of the ditch may be required to be modified to meet the minimum design requirements.
- Ditch 7 and Ramps 1, 2, and 3 ditches were not constructed. Due to the timing of construction and the onset of the freshet these ditches were not constructed. These ditches should be constructed in the Phase 2 campaign.
- An additional culvert (CV8) was installed in the magazine access road. This culvert was not part of the design.

These modifications were made to accommodate field conditions and timing constraints. The modifications were made in discussion with Golder and are considered to have no material effect on the completed work relative to the design.

Alterations and maintenance may be required in the future to accommodate these modifications. Refer to a Section 8.0 for the path forward.

6.0 DISCUSSION ON CONSTRUCTION ACTIVITIES

Six twin culverts and 1 single culvert were installed and the existing ditch was protected with rip rap (Material Type 19) along the mine haul road between April 25, 2016 and May 15, 2016. Best efforts were made to remove the snow and ice from the construction areas and backfill material. Based on the encountered field conditions the culverts locations were adjusted to best fit the existing topography. The culvert trench was excavated by drilling and blasting due to the frozen ground conditions. Each culvert crossing, except for culvert CV2, was excavated and backfilled in two sections (left and right side of the haul road) to allow for haul traffic during construction. Bedding (Material Type 5) was placed and shaped by excavator bucket. Compaction of the trench backfill material (Material Types 5 and 8) was completed by a minimum of 5 passes with a walk behind plate tamper. The culvert inlet basins were drilled and blasted and lined with geotextile with the exception of culvert CV2 (through ramp 1) where geotextile was not used. Rip rap was placed within the culvert inlet basin and along the downstream outflow pad.

The existing ditches were cleared of snow and inspected. Due to the time constraints and weather conditions the existing ditches were not modified. The existing ditches were observed to have little to no erosion protection. Rip rap (Material Type 19) was added along the length of the ditch, and in steep sections geotextile was placed prior to rip rap.

7.0 CONSTRUCTION QUALITY CONTROL AND ASSURANCE

Construction quality control was provided by the Contractor. Quality assurance was provided by the Owner's Representative. No material testing was completed on the material types. Material was visually observed to meet specifications.

Inspection checklists were completed as record of the works being carried out as per the requirements of the specifications and are provided in Appendix C along with a photograph log of each culvert crossing and the ditch.

8.0 PATH FORWARD

The summary of the outstanding items from Phase 1 construction plus the additional requirements in Phase 2 construction are provided below:

- A post-construction inspection by a member of Golder's engineering team is to be carried out. The requirements of constructing the drainage swale between stations 103+750 to 105+250 as well as locations of sediment traps will be identified. It is expected that this inspection will be scheduled during 2016 prior to the onset of snowfall conditions.

- Sections of the ditch should be modified to meet the design requirements if performance and/or observations indicate such.
- The rip rap rock sizes used in the ditch and culvert inlet basins and outflow pads are insufficient for the design storm as described in the design report (Golder 2016). Rip rap in the specification was provided as it was the only size of material available at the time of construction however based on the design calculations sections of the ditch will require upgrading of the erosion protection. As per the design, ongoing inspection and maintenance of the rip rap is to be carried out.
- Develop and implement an inspection and maintenance program as per the design (Golder 2016a).
- Connect the downstream outflow pad to a stream/ flow path with sufficient protection to convey the design storm as per the design (Golder 2016a).
- Implement improvements to the mine haul road to reduce sediment loading (Golder 2016b).

9.0 CLOSING

The Phase 1 construction campaign was completed in substantial compliance with the design intent based on Golder's review of the information provided by Baffinland. Field changes that were made to suit the field conditions encountered have been described in Section 5. A path forward has been described in Section 8.

We trust this report provides the information you presently require. Should you have any comments or questions, please contact the undersigned.

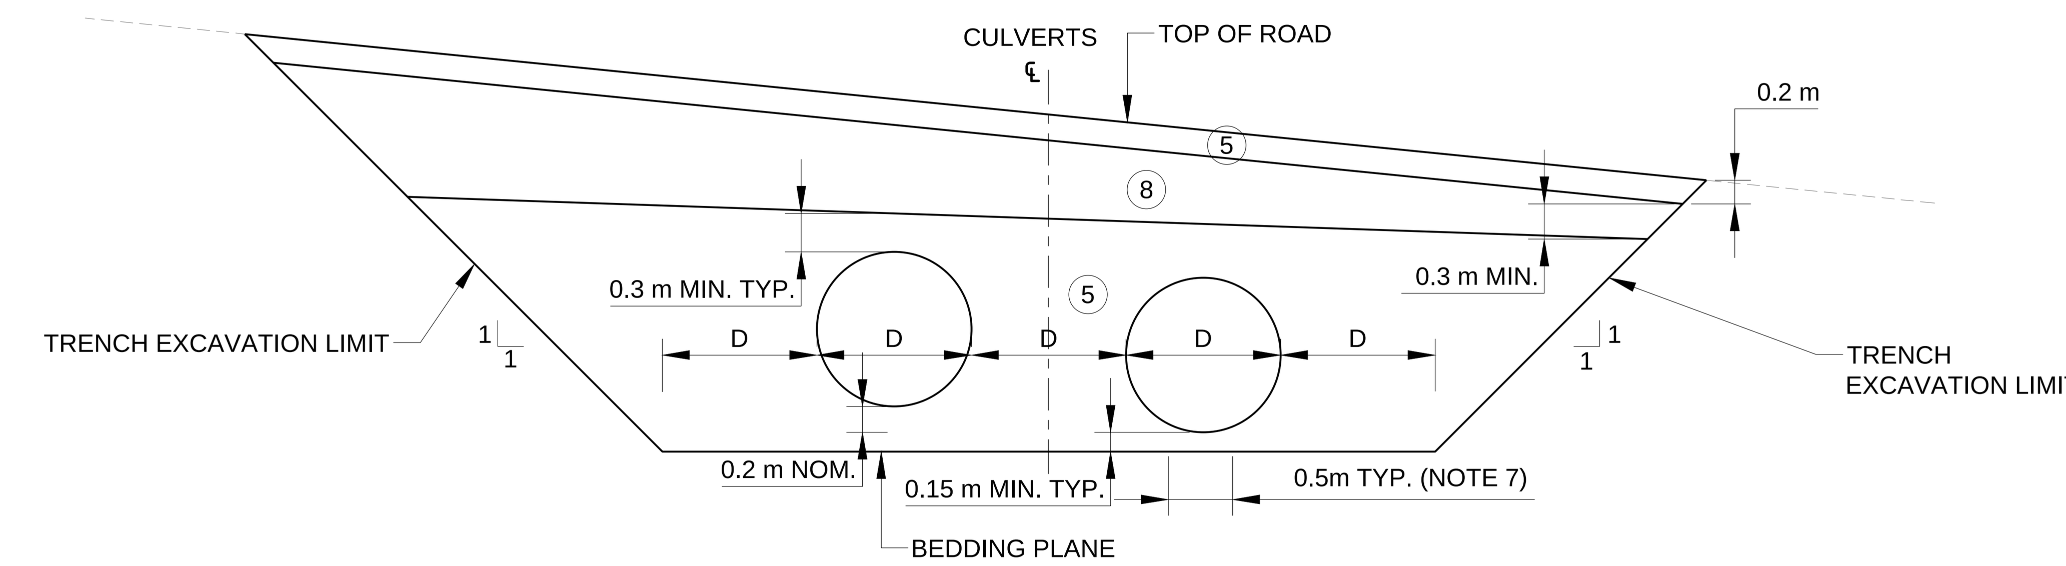
SCALE 1:200



SCALE 1:50 C 014 TYPICAL PIPE CROSSING SECTION

LEGEND

- (5) SCREENED MATERIAL
- (8) JAW RUN
- (19) EROSION PROTECTION (NOTE 9)

NOTES

1. PIPE CROSSING LAYOUT WAS ADJUSTED BASED ON ENCOUNTERED FIELD CONDITIONS AS DIRECTED BY THE OWNER'S REPRESENTATIVE.
2. GEOTEXTILE WAS PLACED IN ALL INLET BASINS AND OUTFLOW PADS EXCEPT AT CV2.
3. THE INLET BASINS WERE NOT CONSTRUCTED TO DESIGN DIMENSIONS DUE TO THE FROZEN GROUND CONDITIONS.
4. NO SURVEY INFORMATION WAS PROVIDED FOR THE DOWNSTREAM OUTFLOW PADS.
5. NO SURVEY INFORMATION WAS PROVIDED FOR THE BACKFILL LAYERS. LAYER THICKNESS WAS OBSERVED BY THE OWNER'S REPRESENTATIVE IN THE FIELD.
6. CULVERT SKEW WAS ADJUSTED BY THE OWNER'S REPRESENTATIVE BASED ON ENCOUNTERED FIELD CONDITIONS.
7. BEDDING WAS SHAPED TO RECEIVE THE PIPE.
8. IT IS RECOMMENDED THAT EROSION PROTECTION OF THE DOWNSTREAM OUTFLOW PAD BE EXTENDED TO A WATER BODY CAPABLE OF CONVEYING THE CONCENTRATED FLOW TO PREVENT EROSION OF THE NATURAL SOILS.
9. THE EROSION PROTECTION ROCK SIZE IS SMALLER THAN REQUIRED FOR THE SELECTED 1:10 YEAR DESIGN FLOW. THIS IN IN RECOGNITION OF THE AVAILABLE MATERIAL AND AT THE OWNER'S REQUEST. RIPRAP BLOCKS COULD MOBILIZE EVEN DURING FREQUENT FLOOD EVENTS, WHICH MIGHT IMPACT SIGNIFICANTLY THE OPERATION OF THE DRAINAGE SYSTEM. REGULAR MAINTENANCE WILL BE REQUIRED. FUTURE IMPROVEMENTS (I.E. REPLACEMENT OF EROSION PROTECTION WITH MATERIAL WITH LARGER ROCK SIZES, PLACEMENT OF GABION MATS) ARE RECOMMENDED.
10. REFER TO DWG. 002 FOR ADDITIONAL NOTES.
11. AS-BUILT SURVEY DATA WAS PROVIDED ON MAY 30, 2016 BY NUNA LOGISTICS AND IS SHOWN AS PROVIDED UNLESS OTHERWISE INDICATED.
12. THE GEOTECHNICAL ENGINEER'S SEAL ON THIS DRAWING VERIFIES THAT THE AS-BUILT INFORMATION PROVIDED BY OTHERS AND REVIEWED, BUT NOT INSPECTED BY THE GEOTECHNICAL ENGINEER, HAS NO MATERIAL EFFECT ON THE DESIGN OF THE COMPLETED WORK.

1. DITCH LAYOUT WAS ADJUSTED BASED ON ENCOUNTERED FIELD CONDITIONS AS DIRECTED BY THE OWNER'S REPRESENTATIVE.
2. THE POTENTIAL SEDIMENT TRAPS WERE NOT CONSTRUCTED IN THIS CONSTRUCTION PHASE.
3. THE POTENTIAL DRAINAGE SWALE WAS NOT CONSTRUCTED IN THIS CONSTRUCTION PHASE.
4. THE CONFIGURATION AND THE EROSION PROTECTION THICKNESS VARIED FROM DESIGN FOR THE DITCH DUE TO THE ENCOUNTERED FIELD CONDITIONS.
5. GEOTEXTILE WAS PLACED IN STEEP SECTIONS OF THE DITCH.
6. RANGE OF BASE WIDTH BASED ON AS-BUILT CROSS-SECTIONS SPACED AT 50 m.
7. DITCH 7, RAMP 1 DITCH, RAMP 2 DITCH AND RAMP 3 DITCH WERE NOT CONSTRUCTED IN THIS CONSTRUCTION PHASE.
8. THE EROSION PROTECTION ROCK SIZE IS SMALLER THAN REQUIRED FOR THE SELECTED 1:10 YEAR DESIGN FLOW. THIS IN IN RECOGNITION OF THE AVAILABLE MATERIAL AND AT THE OWNER'S REQUEST. RIPRAP BLOCKS COULD MOBILIZE EVEN DURING FREQUENT FLOOD EVENTS, WHICH MIGHT IMPACT SIGNIFICANTLY THE OPERATION OF THE DRAINAGE SYSTEM. REGULAR MAINTENANCE WILL BE REQUIRED. FUTURE IMPROVEMENTS (I.E. REPLACEMENT OF EROSION PROTECTION WITH MATERIAL WITH LARGER ROCK SIZES, PLACEMENT OF GABION MATS) ARE RECOMMENDED.
9. REFER TO DWG. 002 FOR ADDITIONAL NOTES.
10. AS-BUILT SURVEY DATA WAS PROVIDED ON MAY 30, 2016 BY NUNA LOGISTICS AND IS SHOWN AS PROVIDED UNLESS OTHERWISE INDICATED.
11. THE GEOTECHNICAL ENGINEER'S SEAL ON THIS DRAWING VERIFIES THAT THE AS-BUILT INFORMATION PROVIDED BY OTHERS AND REVIEWED, BUT NOT INSPECTED BY THE GEOTECHNICAL ENGINEER, HAS NO MATERIAL EFFECT ON THE DESIGN OF THE COMPLETED WORK.

Table of Contents

1. Introduction

This addendum to the Milne Port Stockpile Settling Ponds Construction Summary Report addresses the ditches, swales and road crossing around the perimeter of the Milne Port stockpile pad. This infrastructure is designed to collect runoff water from the stockpile pad and divert it to the two settling ponds. Construction of this infrastructure was not completed at the time of submission of the original Construction Summary Report, hence the requirement for this addendum.

2. Construction Activity Summary

The construction activities on the Milne Port stockpile settling pond drainage ditches started in May 2016 and were completed in June 2016.

The following summarizes the construction activities:

- Excavate ditch/swale.
- Construct berm.
- Place culverts.
- Backfill culverts.

3. Photographic Records

Figure 1: View looking South West showing Stockpile, Stockpile Pad, Drainage Ditch and Berm

Figure 2: View looking North East showing Culvert being Placed

Figure 3: View looking North East with Swale, Berm and Back Filled Culvert

Figure 4: View looking East with Swale, Berm and Culvert

Figure 5: View looking North East with Swale being Excavated

Figure 6: View looking North West with Swale, Berm and Drill Rig in Background

Figure 7: Excavator Bucket Ripping Pre Drilled Permafrost

Figure 8: View showing Ground Thaw Unit being Prepared for Use

Figure 9: View looking North in to West Runoff Pond with Culvert Placed

Figure 10: View looking North showing Drainage Ditch Diversion around Frozen Ore/Snow Stockpile

4. As Built Drawings

The as-built drawings incorporate survey data and field sketches provided by Baffinland.

A list of As Built drawings is provided in Table 4-1 and copies are attached in Appendix A.

Table 4-1: Milne Port Stockpile Runoff Drainage 'As-Built' Drawing List

Drawing Number	Title	Revision
H349000-2133-10-035-0001	Milne Port Ore Stockpiles No. 1 & 2 Earthworks & Drainage - Plan	3
H349000-2133-10-035-0002	Milne Port Ore Stockpiles No. 3 & 4 Earthworks & Drainage - Plan	3

5. Field Decisions

The following section describes field decisions made during construction:

a) Frozen ground made excavation of the ditches to the design depth difficult in areas where the trench is deeper. The Baffinland construction team used the following methods to excavate frozen ground:

- Excavate to frozen ground, then wait a day and re–excavate, giving the ground time to thaw between excavations.
- Rip the frozen ground prior to excavation.

- Drill a pattern of tightly spaced holes prior to excavation. Refer to Figure 6 and Figure 7.
- Use ground thaw units. Refer to Figure 8.

b) When water started flowing through the new ditch in to the West drainage pond, erosion of the pond inlet embankment was observed. A culvert was installed to prevent further erosion. Refer to Figure 9.

c) In limited locations on the East and West side of the pad, stockpiles of snow mixed with ore were positioned over the design ditch alignment. These snow/ore stockpiles resulted in the ground being frozen right to the surface. Rather than excavate the frozen ground, a field decision was taken to divert the ditch around the stockpiles. Refer to Figure 10.

d) Puddles of water on the stockpile pad were pumped direct to the runoff pond, so that they did not drain in to the ditch during construction.

e) On the East side of the stockpile pad, the designed ditch alignment was diverted to the West to maintain the existing service road alignment.

f) An additional culvert was added on the North of the stockpile pad, to enable continued use of the existing site constructed access road on to the ore dock.

g) The location of the South access road on to the ore pad was moved West, to enable continued use of the existing pad access road.

6. Earthworks Data

The survey data collected by Baffinland has been included in Appendix B.

7. Unanticipated Observations

The following unanticipated observations occurred during construction of the drainage ditch:

a) Challenges were experienced excavating the frozen ground down to the required elevation at the bottom of the ditch.

b) Erosion of the pond inlet embankment was initially experienced. A culvert was placed to prevent further erosion.

c) Location of site constructed access roads did not align with the design locations. One culvert crossing was added and one culvert crossing was relocated to accommodate this change.

Baffinland HATCH

Project Memo

H349002

2016-09-30

To:	**Baffinland** Jim Millard	From:	**Hatch** Matthew Buykx
cc:	Wayne McPhee		James Cleland

Baffinland Iron Mines Corporation

Mine Site Crusher Pad Drainage

As requested, Hatch has revised the Mine Site Ore Crushing & Screening Earthworks & Drainage – Plan drawing (Drawing Number H349000-4133-10-035-0001) to As-Built status. This revised drawing now shows the drainage ditches and swales constructed by Baffinland Iron Mines (BIM). The drawing revision is based on survey data and photos provided by BIM.

RE: ANNUAL GEOTECHNICAL INSPECTIONS
BAFFINLAND IRON MINES CORPORATION
OUR REFERENCE NO. 16-094

1.0 INTRODUCTION

Barry H. Martin, P. Eng., Consulting Engineer, completed the eighth annual water licence geotechnical inspection of the following on-site engineered facilities as required by Licence No. 2AM-MRY 1325 of the Nunavut Water Board:

Pit Walls
Quarries
Landfills
Land Farms
Bulk Fuel Storage Facilities
Sediment Ponds
Collection Ponds
Polishing and Waste Stabilization Ponds

The inspection that took place July 28th to July 30th, 2016 is the first phase of a biannual inspection to be carried out within the open water shipping season at the two Baffinland sites, in Mary River at the mine site, and at Milne Inlet at the port facility.

The inspections were carried out in accordance with the guidelines set out in "Dam Safety Guidelines 2007" as published by the Canadian Dam Association.

The inspections were completed by Mr. Barry H. Martin, P. Eng., the design Engineer for the initial containment facilities both at Mary River and Milne Inlet, the runaway extension, initial bridges on the connecting road, the solid waste disposal site as well as continuing construction of select mine infrastructure.

The eight previous annual water licence geotechnical inspections were completed by Mr. Martin. You shall note that Hazardous Waste Containment Structures have been assigned designations in the report that were established by the Environmental group in past years.

The facilities inspected are as per the following:

Mary River Site

Bulk Fuel Storage Containment
Generator Fuel Storage Facility Containment
Polishing/Waste Stabilization Pond No. 1
Polishing/Waste Stabilization Ponds Nos. 2 and 3 (constructed as a two-cell structure)
Helicopter Fuel Cell Containment
Barrel Fuel Containment (constructed as a two-cell structure) (MS-HWB-3 and MS-HWB-4)
Hazardous Waste Storage (MS-HWB-2)
Enviro-Tank Storage (constructed contiguous with hazardous waste storage and stove oil storage) (MS-HWB-1)
Stove Oil Storage (MS-HWB-5)
Solid Waste Disposal Site
Minesite Steel Fuel Tank Farm Containment
Quarry
Crusher Pad Drainage Containment
Waste Pile Drainage Containment
Jet "A" Aircraft Containment
Hazardous Waste Containment (MS-HWB-6)

A site plan for the Mary River site showing most structures reviewed is attached.

Milne Inlet Site

Hazardous Waste Storage (constructed as a two-cell structure) (MP-HWB-3 and MP-HWB-4)
Fuel Tank Farm
New Sewage Effluent Pond (PWSP)
Land Farm
Contaminated Snow Containment
Sediment Ponds East and West
Quarry
Loading Area Contaminated Storage (MP-HWB-1)
Fuelling Facility Containment

A site plan for the Milne Inlet site showing most structures reviewed is attached.

2.0 METHODOLOGY FOR INSPECTION

The geotechnical inspector was Barry H. Martin, P. Eng., who reviewed the two sites for the first of the biannual inspections on July 28th, 2016 to July 30th, 2016 just as the annual shipping season commenced with the arrival of the first ship into port. There is a further inspection planned to take place at the end of the shipping season at the end of September / beginning of October.

The inspections primarily focused on the following aspects:

1. The structures were inspected for conformance with the design basis as presented in "as-constructed" and "as-built" drawings (provided in the first and subsequent reports).

2. The structures were specifically inspected for settlement, cracking, and seepage through the berms.

3. The areas around the structures were examined for evidence of seepage.

4. Quarry walls were reviewed for relative stability. I note that the quarries were active removal areas and long term stability was not yet established.

5. New structures recently constructed were reviewed for conformity with design drawings.

6. Photographs were taken to document observations made during the inspection and are attached.

3.0 MARY RIVER CAMP

3.01 General

As with other years, there had been some rainfall at Mary River preceding this first inspection and it was expected that there would be some water in the containment dykes.

A monitoring program is in place to test storm water that does accumulate within the containment structures. As reviewed, the water that does not meet the water licence effluent requirements is treated on site prior to release. In some cases, water collected within the structures has been pumped out.

At the Bulk Fuel Storage Facility Containment, the water that collects within the dyke is treated at the end of the containment structure.

As with the report last year there are some new code names assigned to the containment structures.

The Bulk Fuel Storage Containment (Exploration Phase Bladder Farm) is coming due for decommissioning and is currently used to store barrels of fuel, lubricant cubes, and a large fuel tank.

3.02 Bulk Fuel Storage Facility (Exploration Phase Bladder Farm)

General Conditions

The Bulk Fuel Storage Facility still exists but it is no longer utilized as a bulk fuel storage facility. There are a number of full fuel barrels now stored within the berms, as well as a large fuel tank.

The granular cover over the geotextile and liner is still in place within the containment structure and is awaiting land farming and a fair amount of water at one end awaiting treatment is contained within the dykes.

Stability

At the time of this review, water had not been removed for a period from within the containment and water was ponding above the level of the gravel within the bottom of the containment at the north end of the facility.

At the load-out end of the facility there was minor water ponding within the dykes.

The soil structure is considered stable in the present condition and is in conformance with the design basis for the facility.

The presence of water within the structure and at the load-out area is an indication of the integrity of the liner.

The dykes have been built up recently to reinforce the concept of no loader travel over the dykes.

Recommendations

We have no recommendations with respect to this containment structure as it awaits decommissioning other than to note that it may make an ideal land farm.

3.03 Generator Fuel Storage Containment (Exploration Phase)

This particular containment structure is currently being decommissioned. The fuel bladder that was contained within the dyke had been removed prior to our second inspection in 2015.

The granular fill over the geotextile and liner shall require landfarming with the material from the bulk fuel storage facility.

There is no indication that the liner is compromised and decommissioning should proceed when the granular cover is either moved to a land farm or other containment. There is water ponding within the structure.

3.04 Polishing/Waste Stabilization Pond #1

General Conditions

PWSP No. 1 continues to be utilized as a holding facility for sewage plant effluent that does not meet water effluent quality criteria.

Currently the pond is being used primarily as a repository for off spec sewage and sewage sludge forming in lift stations.

The supernatant from PWSP No. 1 is periodically decanted to PWSPs Nos. 2 and 3 where it is tested and treated as required to meet Water Licence effluent requirements.

At the time of our visit there was less than fifty percent of capacity in use and the structure readily conforms to its design intent.

Stability

Our review of this area around the pond at the base of the slopes showed no sign of seepage and hence we conclude that the liner has been effective in containing sewage and there are no tears or ruptures in the membrane, excepting some minor tears from past activity at the top of the dyke well above the allowable effluent level in the structure, in the horizontal portion of the membrane.

A review of the top of the dyke showed no indication of cracking or settlement which would indicate stresses within the structure.

Many of the tears that had occurred in the liner on the top of the dyke have been patched during the period between reviews in 2008 and 2009 and are holding well. As well, there are no signs of weather related deterioration of the liner where it is exposed.

There appears to be no sign of erosion of the dykes, even with the precipitation that has occurred over the lifetime of the facility.

The minor settlements that have taken place have had little effect on the integrity of the structure.

Recommendations

We have no recommendations with respect to this containment facility.

3.05 Polishing Ponds/Waste Stabilization Ponds #2 and #3

General Conditions

The structure was designed and constructed as a two-cell structure.

The supernatant from PWSP #1 is currently discharged to PWSPs Nos. 2 and 3. The treated effluent is tested for Water Licence effluent requirements, treated if necessary, and discharged to the environment.

At the time of our visit there was considerable freeboard to accommodate further sewage and the structure readily conforms to its design intent. Both cells were almost empty and contained less than 1' of liquid which was the capacity allowed for sludge in the design.

Stability

Our review of the area around the pond at the base of the slopes showed no sign of seepage and hence we conclude that the liner has been effective in containing the sewage and there are no tears or ruptures in the membrane.

Longitudinal cracking which appeared in the dykes of PWSP #3 due to the melt of permafrost wedges in 2009 has not reoccurred and we consider this structure to be stable in its present condition.

Monitoring points have been set upon the top of the dyke and have been monitored since 2009. Settlements have occurred since that time. These settlements have not led any stress cracks in the structure. Monitoring has been discontinued.

There appears to be no sign of erosion of the dykes and plants are continuing to seed themselves on the dykes. This growth is minimal, but increasing.

There are small bubbles formed by air trapped under the enviroliner that were present in the first review that are probably the result of wrinkles in the liner that should disappear if further liquid is added to the cell.

Recommendations

We have no recommendations with respect to this containment facility.

3.06 Helicopter Fuel Tank Containment

General Conditions

The structure was designed and constructed as a single cell structure that contains a 1000 gal fuel storage tank.

The structure currently conforms to its design intent.

In the past, a liner clad wood curb had been added to the top of the berm to prevent the erosion of gravel off the berm, caused by pulling the fuel hose from within the dyke out to the helicopters to provide them with fuel.

As it is the intent of the mine to use fuel that is available in barrels, a temporary cell has been constructed to contain the barrels with a one piece liner and wood timbers.

Stability

Our review of the area around the pond at the base of the slopes showed no sign of seepage. There is wet sand in the bottom of the containment indicating the integrity of the liner.

A review of the exterior and the top of the berms showed no sign of cracking or settlement which would indicate stress within the structure.

The structure is considered to be stable in its present condition.

Recommendations

We have no recommendations with respect to this structure. It is assumed the temporary containment shall be removed when the barrel fuel has been utilized.

3.07 Barrel Fuel Containment (MS-HWB-3 and MS-HWB-4)

General Conditions

This particular structure which we called "Barrel Fuel Containment" in our previous inspection reports is a two-cell structure which is currently used to accommodate cubes of lubricant and barrels in the east cell and cubes of lubricant and antifreeze in the west cell.

Stability

Our review of the area around this containment structure showed no sign of seepage. This shows that there is reasonably little chance of tearing or rupture of the membrane having taken place.

A review of the exterior and top of the dyke showed no sign of cracking or settlement which would indicate stresses within the structure.

The structure is considered to be stable in its present condition.

As with the Bulk Fuel Storage Containment, the dykes have been built up to discourage any possible travel over these dykes.

Recommendations

We have no recommendations at this time.

3.08 Hazardous Waste Storage (MS-HWB-2)

General Conditions

This particular cell was constructed contiguous with an existing cell, which is referred to on site as the "Enviro Tank Storage", from drawings by our office in 2010 and conforms to our drawings. It is also contiguous with the Stove Oil Storage cell.

This structure contains barrels and bags of hazardous waste.

Stability

Our review of the area around this cell at the base of the slopes, showed no sign of seepage. There is water ponding in this structure.

The structure appears to be stable in its present condition. The water confirms the integrity of the liner.

Recommendations

There are no recommendations at this time.

3.09 Enviro Tank Storage (MS-HWB-1)

General Conditions

This particular structure is constructed contiguous with the Hazardous Waste Storage constructed in 2010 and the Stove Oil Storage cell. It was utilized as a wash down cell during the past seasons. It is currently not being used and access is blocked.

Stability

In 2014 there was concern for the integrity of this cell as the cell was dry and the geotextile was exposed from heavy traffic during our initial inspection. During our second inspection, the cell was holding a small amount of water confirming limited integrity of the liner.

The cell is dry this year raising concerns anew on the integrity of the liner. We concur with the fact that use of this cell has been abandoned and the cover in the cell awaits landfarming.

Recommendations

We recommend that the geotextile over the liner be checked and the granular cover be made good prior to continuing use of this cell or that this cell be permanently decommissioned.

3.10 Stove Oil Storage (now MS-HWB-5)

General Conditions

This particular structure had been used to store barrels of stove fuel in past years and is still utilized for this purpose of storing barrel fuel.

Currently, access to this cell has been blocked with granular fill.

This structure was constructed in accordance with a standardized drawing provided by this office utilizing a one piece liner.

Stability

Our review of the exterior and the top of the dyke showed no sign of seepage. This shows that there is reasonably little chance of tearing or rupture of the membrane having taken place.

A review of the exterior and the top of the dyke showed no sign of cracking or settlement which would indicate stresses with the structure.

There is water contained within the cell confirming the integrity of the liner.

The structure is considered to be stable in its present condition.

3.11 Solid Waste Disposal Site

The solid waste disposal site is currently entering the second phase of its construction. The first lift of solid waste has been placed and covered fully and appears to be doing exactly what it was proposed to do at the design stage.

Work is currently being done on building a berm on three sides of the disposal side at a level above the existing lift in advance of placing another lift. The berm is being constructed as per the berm on the first level that served us well over the past several years.

The blow fence has not been reinstalled yet. In the meantime, solid waste has been covered as it is installed and may be continued to be done in this manner to control "blow".

We are most pleased with what we saw at this site.

3.12 Minesite Steel Fuel Tank Farm Containment

General Conditions

All work appears to be complete excepting the installation of the sump pits that are on site awaiting installation and which shall be utilized to facilitate the removal of water that collects from precipitation.

There is water ponding in the bottom of the containment confirming the integrity of the liner. This ponding of water is now above the cover on the bottom of the containment.

Stability

All work appears to have been completed in accordance with drawings and we have no concerns with the stability of this containment structure.

Recommendations

We recommend that at least one sump be installed as per the drawings prepared for this facility and that when weather permits, removal of water within the containment.

3.14 Quarry QMR2

General Conditions

The quarry has well defined benches. The quarry faces at the benches appear clean.

The quarry is inactive at this time but definitely not closed.

The area where the road was undermined in September 2015 has undergone further quarrying and the access road is gone This area is a fractured zone and subject to subsidence as we noted while on site.

Stability

Care must be taken while quarrying in the unstable fractured zone.

3.14 Crusher Pad Drainage Containment

General Conditions

There is a new containment constructed to catch surface water flow from the crushing area and stockpile area at the minesite. The catchment ditches that had not been quite completed beyond the pond at the time of our last inspection, have now been completed for the entire pad.

Stability

The structure has been completed in accordance with drawings included in our earlier report in a most satisfactory manner.

Recommendations

We have no recommendations with respect to this containment structure.

3.15 Waste Stockpile Drainage Containment

Stability

The dyke appears stable at this time.

This particular structure has now been completed and is as shown on the aerial photograph for this structure. The structure is in place and only minor trimming is required at the inlet side. The outfall hose to pump the supernatant water over to the Mary River watershed is under construction with the pump in place on the dyke.

It is currently working as per the design intent.

3.16 Jet "A" Fuel Containment and Pump

This cell was constructed to replace the containment structure near the Weatherhaven Camp.

This cell now contains two double walled tanks and is located north of the air terminal buildings.

Stability

The cell was constructed using a one piece enviroliner and geotextile and was constructed in accordance with standardized drawings prepared in the past for such construction by our office.

There were no signs of cracking of the dykes. A granular ramp has been constructed over the dyke to facilitate access for snow removal. There was water ponding in the cell at the time of our inspection indicating the integrity of the liner.

Recommendations

We have no recommendations at this time.

3.17 Hazardous Waste Containment (MS-HW-6)

General Conditions

Although it was constructed in 2012, we first reported on it in 2015.

It is located near the incinerator and is utilized to store barrels of ash from the incinerator and other hazardous waste.

Stability

The cell was constructed utilizing a one piece enviroliner with geotextile and was constructed in accordance with standardized drawings prepared in the past for such construction by our office.

There is water ponding in the bottom of the cell confirming the integrity of the liner.

There were no signs of cracking of the dykes or seepage around the exterior of the dykes.

Recommendations

The liner at the back of the cell on the dyke has been torn while placing a pallet supporting hazardous waste into the cell. This torn liner should be repaired.

3.18 Overview

This report is the eighth annual Geotechnical Inspection at Mary River and Milne Inlet completed by this author on behalf of Baffinland Iron Mines Corporation and the second year of reporting covering the first of two inspections in one shipping season.

As set out in our past reports, there has been little or no erosion taken place from wind or rain and the dykes constructed of the sand/gravel soil have remained stable at slopes of 3:1 and 4:1.

As noted two years ago, there are only just now signs of settlement appearing at PWSP's 1, 2 and 3. The settlements are not differential settlements of the dykes but are minor overall settlements of the total structures with respect to the surrounding area.

These settlements appear to be settlements within the one metre ± active layer above the permafrost and are of little concern as the PWSP's are temporary structures and the settlements have no effect on the dyke stability.

It is expected that many of the structures that form the basis for the inspections set out in the biannual Geotechnical inspections shall be decommissioned as the mine facilities are finalized.

A number of these structures are awaiting the construction of a land farm to facilitate the disposal of contaminated granular fill from the bottom of containment cells.

4.0 MILNE INLET

4.01 General

There are still changes taking place at Milne Inlet, since our last inspection in September of last year.

The sediment ponds at the shore that were under construction last season are now operational.

Since our last review, all facilities are fully functional except for minor shortcomings.

4.02 Hazardous Waste Storage (MP-HWB-3 and MP-HWB-4)

General Conditions

This particular structure has been constructed as a two-cell structure and is now only used to store a few items.

A new hazardous waste storage facility has now been constructed near the loadout area for storing hazardous waste to be shipped out and is in full operation at this time.

Stability

There is no water ponding in both cells of the original structure. We are advised that water has been pumped from these structures and sand in the structures is wet.

Our review of the area around the dykes, at the base of the slopes, showed no sign of seepage. The structure is considered stable.

Recommendations

We have no recommendations with respect to the use of these two cells at this time. Prior to our inspection in September, we request that water not be pumped from the structures.

4.03 Fuel Tank Farm

General Conditions

Since both 2012 and 2013 the fuel tank farm has been expanded considerably with the addition of a number of new tanks. No tanks have been added since last season but there is room to place additional tanks.

We note that the sump placed in the containment is still located at the high end of the containment. There is water ponding in the low end of the containment.

Stability

We have minor water ponding at the low end of the containment confirming the integrity of the liner.

Recommendations

We recommend that a sump be considered at to the low point at the north end of the containment, to better facilitate the removal of water to minimize the treatment of water should a minor spill occur within the containment.

4.04 New Effluent Pond (PWSP)

General Conditions

The pond was put into operation in 2014.

The containment pond was operating at approximately sixty-percent of capacity at the time of our inspection.

Stability

We noted no sign of weakness in any of the construction.

Recommendations

We have no recommendations with respect to the use of this structure having no negative comments on the construction of this structure.

4.05 Landfarm Containment

General Conditions

The landfarm containment is complete except for soil cover on the dykes in the area of the sump.

The landfarm was constructed to accommodate approximately 9000 m^3 of oil contaminated soil and seasonal water accumulations.

At the time of our inspection the landfarm was in operation and some sorting of contaminated materials had taken place.

There is considerable contaminated waste in the landfarm in addition to contaminated soil. No landfarming of treated contaminated soil has taken place.

It appears as though the structure has been constructed in accordance with good construction practice for structures of this type.

Stability

The structure appears stable as constructed.

Recommendations

We recommend that the remaining dyke structure, without protective cover over it, be covered as per the design drawings. This, however, is not an absolute requirement.

4.06 Contaminated Snow Containment

General Conditions

The construction of the contaminated snow containment structure is contiguous with the east end of the landfarm.

It appears as though the structure has been constructed in accordance with good construction practice for structures of this type.

The snow containment facility has a containment volume of 929 m^3 based on estimates of snow volume provided by the owner and only a small percentage of the capacity is utilized.

The structure has been constructed with good quality control.

Stability

The structure appears stable as constructed.

Recommendations

We have no recommendations with respect to this construction at this time.

4.07 Sediment Pond East

General Conditions

The construction of this sedimentation pond for drainage from the east side of the site is complete.

The basin is shaped and the liner has been installed throughout the basin from inlet to the berms on the north side of the basin.

There has been no cover placed over the liner to this point and rip rap has not yet been placed in the outlet weir.

The liner at the inlet has tears and punctures and water can leak out under the liner at this time.

Stability

We still have concerns over the stability of the liner and recommend possibly tire ballast over the liner which appears possibly subject to wind damage. This shall provide a function for used tires.

Recommendations

We recommend review of the use of a ballast (possibly tires) on the exposed liner at the dyke to prevent wind uplift.

We further recommend the re-installation of the liner at the inlet.

4.08 Sediment Pond West

General Conditions

The construction of this sedimentation pond for drainage from the west side of the site is nearing completion except for the west end on the south side where the liner must be "tucked" in as set out in our report last year.

As well, the inlet culvert construction is allowing water to be conducted under the liner and must be repaired.

Stability

We have some concern over the stability of the liner on this pond as we have with the east pond and recommend the further use of tire ballast on the liner.

Recommendations

Complete construction at the inlet structure to ensure contaminated water flows into the containment and not under it.

4.09 Quarry

General Conditions

The quarry was inactive at the time of our review and most blasted rock had been removed from the quarry site.

Stability

Rock faces appear stable.

Recommendations

We have no recommendations to be made with respect to the quarry.

4.10 Loading Area Contaminated Storage (Now MP-HWB-1)

General Conditions

This area has been constructed near the loading dock to facilitate assembly of hazardous materials for shipment out. It appears that all material from the temporary hazardous storage containment have now been assembled here.

Construction appears to have taken place in accordance with standardized drawings prepared in the past.

Stability

Construction appears stable.

Recommendations

We have no recommendations with respect to this structure.

4.13 Fueling Facility Containment

General Conditions

A new fueling facility for the fueling of B trains is under construction utilizing design drawings prepared by our office.

Work conforms to the design drawing.

A second cell is now to be constructed south of the existing.

4.12 Overview

Work on containment structures is now almost complete and only the hazardous waste cells MP-HWB-3 and 4 require decommissioning.

Respectfully submitted,

RE: ANNUAL GEOTECHNICAL INSPECTIONS
BAFFINLAND IRON MINES CORPORATION
OUR REFERENCE NO. 15-097

1.0 INTRODUCTION

Barry H. Martin, P. Eng., Consulting Engineer, completed the eighth annual water licence geotechnical inspection of the following on-site engineered facilities as required by Licence No. 2AM-MRY 1325 of the Nunavut Water Board:

Pit Walls
Quarries
Landfills
Land Farms
Bulk Fuel Storage Facilities
Sediment Ponds
Collection Ponds
Polishing and Waste Stabilization Ponds

The inspection that took place October 5 to October 11th, 2016 is the second phase of a biannual inspection to be carried out within the open water shipping season at the two Baffinland sites, in Mary River at the mine site, and at Milne Inlet at the port facility. Although the shipping season extended into October, snow came early in mid September and although inspections were completed , the photos did not show well

The inspections were carried out in accordance with the guidelines set out in "Dam Safety Guidelines 2007" as published by the Canadian Dam Association.

The inspections were completed by Mr. Barry H. Martin, P. Eng., the design Engineer for the initial containment facilities both at Mary River and Milne Inlet, the runway extension, initial bridges on the connecting road, the solid waste disposal site as well as continuing construction of select mine infrastructure.

The seven previous annual water licences geotechnical inspections were completed by Mr. Martin. You shall note that Hazardous Waste Containment Structures have been assigned new designations in the report as compared to previous years.

The facilities inspected are as per the following:

Mary River Site

Bulk Fuel Storage Containment
Generator Fuel Storage Facility Containment
Polishing/Waste Stabilization Pond No. 1
Polishing/Waste Stabilization Ponds Nos. 2 and 3 (constructed as a two-cell structure)
Helicopter Fuel Cell Containment
Barrel Fuel Containment (constructed as a two-cell structure)(MS-HWB-3 and MS-HWB-4)
Hazardous Waste Storage (MS-HWB-2)
Enviro-Tank Storage (constructed contiguous with hazardous waste storage and stove oil storage) (MS-HWB-1)
Stove Oil Storage (MS-HWB-5)
Jet Fuel Tank and Pump Containment
Solid Waste Disposal Site
Minesite Steel Fuel Tank Farm Containment
Quarry
Crusher Pad Drainage Containment
Waste Pile Drainage Containment
Jet "A" Aircraft Containment
Hazardous Waste Containment (MS-HWB-6)

A site plan for the Mary River site showing most structures reviewed is attached.

Milne Inlet Site

Hazardous Waste Storage (constructed as a two-cell structure) (MP-HWB-3, and MP-HWB-4,)
Fuel Tank Farm
New Sewage Effluent Pond (PWSP)
Land Farm
Contaminated Snow Containment
Sediment Ponds East and West
Quarry
Loading Area Contaminated Storage (MP-HWB-1)
Fuelling Facility Containment

A site plan for the Milne Inlet site showing most structures reviewed is attached.

2.0 METHODOLOGY FOR INSPECTION

The geotechnical inspector was Barry H. Martin, P. Eng., who also reviewed the two sites for the first of the biannual inspections on July 28th to August 3rd, 2016 just as the annual shipping season commenced with the arrival of the first ship into port. This particular inspection took place just prior to the end of the shipping season. Although it was possible to complete inspections, snow came early at

Mary River in mid September, and as a result the inspections took place with 2" to 4" of snow on the ground.

The inspections primarily focused on the following aspects:

1. The structures were inspected for conformance with the design basis as presented in "as constructed" and "as-built" drawings (provided in the first and subsequent reports).

2. The structures were specifically inspected for settlement, cracking, and seepage through the berms.

3. The areas around the structures were examined for evidence of seepage.

4. Quarry walls were reviewed for relative stability. I note that the quarries are active removal areas and long term stability was not yet established.

5. New structures under construction were reviewed for conformity with design drawings.

6. Photographs were taken to document observations made during the inspection and are attached. These photos however are somewhat compromised by the slight snow cover.

3.0 MARY RIVER CAMP

3.01 General

Due to the very cold weather encountered during the inspection it was difficult to confirm moisture within the containment structures although ice was found in some.

A monitoring program is in place to test storm water that does accumulate within the containment structures. As reviewed, the water that does not meet the water licence effluent requirements is treated on site prior to release. In some cases, water collected within the structures has been pumped out.

At the Bulk Fuel Storage Facility Containment, the water that collects within the dyke is treated at the end of the containment structure. At the time of this inspection, the treatment equipment had been moved to another location.

As with the report last year, there are some new code names assigned to the containment structures.

We report on the new Jet "A" Fuelling Containment Structure and Hazardous Waste Containment for the first time.

As with the August report of this year there are new code names assigned to hazardous waste structures.

The Bulk Fuel Storage Containment (Exploration Phase Bladder Farm) is coming due for decommissioning but is still used to store barrels of fuel, lubricant cubes, and a large fuel tank at this time.

3.02 Bulk Fuel Storage Facility (Exploration Phase Bladder Farm)

General Conditions

The Bulk Fuel Storage Facility still exists but it is no longer utilized as a bulk fuel storage facility. There are a number of full fuel barrels and lubricant cubes now stored within the berms, as well as a large fuel tank.

The granular cover over the geotextile and liner is still in place within the containment structure awaiting land farming. There is water that is contained within the dykes at one end awaiting treatment.

There is now a ramp over the north end of the containment to permit access over the dyke for placing barrels and cubes for storage.

Stability

At the time of this initial review, water had not been removed for a period from within the containment and water was ponding above the level of the gravel within the bottom of the containment at the north end of the facility. This water was frozen in place as ice.

At the load-out end of the facility there was water ponding within the dykes as ice was present..

The soil structure is considered stable in the present condition and is in conformance with the design basis for the facility.

The presence of water within the structure and at the load-out area is an indication of the integrity of the liner.

The dykes have been built up this year to reinforce the concept of no loader travel over the dykes.

Recommendations

We have no recommendations with respect to this containment structure as it awaits decommissioning.

3.03 Generator Fuel Storage Containment (Exploration Phase)

This particular containment structure is currently being decommissioned. The fuel bladder that was contained within the dyke has been removed.

The granular fill over the geotextile and liner shall require landfarming with the material from the bulk fuel storage facility.

There is no indication that the liner is compromised and decommissioning should proceed when the granular cover is either moved to a land farm or other containment. There is ice within the structure.

3.04 Polishing/Waste Stabilization Pond #1

General Conditions

PWSP No. 1 continues to be utilized as a holding facility for sewage plant effluent that does not meet water effluent quality criteria.

Currently the pond is being used primarily as a repository for off spec sewage and sewage sludge forming in lift stations.

The supernatant from PWSP No. 1 is periodically decanted to PWSPs Nos. 2 and 3 where it is tested and treated as required to meet Water Licence effluent requirements.

At the time of our visit there was approximately fifty percent of capacity to accommodate further sewage and the structure readily conforms to its design intent.

Stability

Our review of this area around the pond at the base of the slopes showed no sign of seepage and hence we conclude that the liner has been effective in containing sewage and there are no tears or ruptures in the membrane, excepting some minor tears from past activity at the top of the dyke well above the allowable effluent level in the structure in the horizontal portion of the membrane.

A review of the top of the dyke showed no indication of cracking or settlement which would indicate stresses within the structure.

Many of the tears that had occurred in the liner on the top of the dyke have been patched during the period between reviews in 2008 and 2009 and are holding well. As well, there are no signs of weather related deterioration of the liner where it is exposed.

There appears to be no sign of erosion of the dykes, even with the precipitation that has occurred over the lifetime of the facility.

The minor settlements have had little effect on the integrity of the structure.

Recommendations

We have no recommendations with respect to this containment facility.

3.05 Polishing Ponds/Waste Stabilization Ponds #2 and #3

General Conditions

The structure was designed and constructed as a two-cell structure.

The supernatant from PWSP #1 is currently discharged to PWSPs Nos. 2 and 3. The treated effluent is tested for Water Licence effluent requirements, treated if necessary, and discharged to the environment.

At the time of our visit there was considerable freeboard to accommodate further sewage and the structure readily conforms to its design intent. Both cells were almost empty and contained less than one foot of liquid as an ice covered liquid which was the capacity allowed for sludge in the original design.

Stability

Our review of the area around the pond at the base of the slopes showed no sign of seepage and hence we conclude that the liner has been effective in containing the sewage and there are no tears or ruptures in the membrane.

Longitudinal cracking which appeared in the dykes of PWSP #3 due to the melt of permafrost wedges in 2009 has not reoccurred and we consider this structure to be stable in its present condition.

Monitoring points have been set upon the top of the dyke and have been monitored since 2009. Settlements have occurred since that time. These settlements have not led to any stress cracks in the structure. Monitoring was discontinued last year.

There appears to be no sign of erosion of the dykes and plants are continuing to seed themselves on the dykes. This growth is minimal, however.

The small bubbles that were observed under the liner at the time of the last inspection were not evident with the colder weather that we have encountered

Recommendations

We have no recommendations with respect to this containment facility.

3.06 Helicopter Fuel Tank Containment

General Conditions

The structure was designed and constructed as a single cell structure that contains a 1000 gal fuel storage tank.

The structure currently conforms to its design intent.

In the past, a liner clad wood curb had been added to the top of the berm to prevent the erosion of gravel off the berm, caused by pulling the fuel hose from within the dyke out to the helicopters to provide them with fuel..

As it was the intent of the mine to use fuel that was available in barrels, a temporary cell had been constructed to contain the barrels with a one piece liner and wood timbers . This containment has been recently removed

Stability

Our review of the area around the pond at the base of the slopes showed no sign of seepage.

A review of the exterior and the top of the berms showed no sign of cracking or settlement which would indicate stress within the structure.

The structure is considered to be stable in its present condition.

Recommendations

We have no recommendations with respect to this structure.

3.07 Barrel Fuel Containment (Now MS-HWB-3 and MS-HWB-4)

General Conditions

This particular structure which we called "Barrel Fuel Containment" in our previous inspection reports is a two-cell structure which is currently used to accommodate cubes of lubricant and barrels in the east cell and cubes of lubricant and antifreeze in the west cell.

Stability

Our review of the area around this containment structure showed no sign of seepage. There is water ponding in this structure as evidenced by the ice in the cell.

A review of the exterior and top of the dyke showed no sign of cracking or settlement which would indicate stresses within the structure.

The structure is considered to be stable in its present condition. The ice confirms the integrity of the liner.

Recommendations

We have no recommendations at this time.

3.08 Hazardous Waste Storage (Now MS-HWB-2)

General Conditions

This particular cell was constructed contiguous with an existing cell, which is referred to on site as the "Enviro Tank Storage", from drawings by our office in 2010 and conforms to our drawings. It is also contiguous with the Stove Oil Storage cell.

This structure contains barrels and bags of hazardous waste.

Stability

Our review of the area around this cell at the base of the slopes, showed no sign of seepage. There is water ponding in this structure as evidenced by ice in the cell.
The structure appears to be stable in its present condition. The ice confirms the integrity of the liner.

Recommendations

There are no recommendations at this time.

3.09 Enviro Tank Storage (Now MS-HWB-1)

General Conditions

This particular structure is constructed contiguous with the Hazardous Waste Storage constructed in 2010 and the Stove Oil Storage cell. It was utilized as a wash down cell during the last season. It is currently not being usedand access is blocked

Stability

Last year there was concern for the integrity of this cell as the cell was dry and the geotextile was exposed from heavy traffic during our initial inspection. During our second inspection, the cell was holding a small amount of water confirming limited integrity of the liner.

The cell is dry this year at both of the 2015 inspections raising concerns anew on the integrity of the liner.

Recommendations

We recommend that the geotextile over the liner be checked and the granular cover be made good prior to continuing use of this cell

3.10 Stove Oil Storage (Now MS-HwB-5)

General Conditions

This particular structure had been used to store barrels of stove fuel in 2011.

The structure again contains barrels of stove oil and some Jet "A" fuel.

This structure was constructed in accordance with a standardized drawing provided by this office utilizing a one piece liner.

Stability

Our review of the exterior at the base of the dyke showed no sign of seepage. This shows that there is reasonably little chance of tearing or rupture of the membrane having taken place.

A review of the exterior and the top of the dyke showed no sign of cracking or settlement which would indicate stresses with the structure.

There is ice contained within the cell confirming the integrity of the liner.

The structure is considered to be stable in its present condition.

3.11 Jet Fuel Tank and Pump Containment

General Conditions

This particular structure was reconstructed based on our recommendation of the 2012 Geotechnical Inspection.

The construction was completed in accordance with our recommendations for such structures and the liner was constructed as a one piece liner with geotextile protection on both sides and gravel over the geotextile as protection.

The construction appears proper and the structure is in good condition.

Minor water ponding confirms the integrity of the liner.

At this time as in our earlier inspection report this year, the jet fuel tank and pump have been removed and the cell is empty.

Stability

Our review of the area around the cell at the base of the slopes showed no sign of seepage and water is ponding within the cell.

.

The structure is stable in its present condition.

Recommendations

There are no recommendations at this time.

3.12 Solid Waste Disposal Site

The solid waste disposal site is currently entering the second phase of its construction. The first lift of solid waste has been placed and covered fully and appears to be doing exactly what it was proposed to do at the design stage. Since our last inspection in July/August the first lift has been expanded.

Work is currently continuing on building a berm on three sides of the disposal site at a level above the existing lift in advance of placing another lift. The berm is being constructed as per the berm on the first level that served well over the past several years,

The blow fence has not been reinstalled yet. In the meantime, solid waste has been covered as it is installed and may be continued to be done to control "blow".

There has been a fence structure of sections of screen and pallets to control snow drift at the activity area of the waste disposal site.

3.13 Minesite Steel Fuel Tank Farm Containment

General Conditions

All work appears to be complete including the installation of the sump pits that shall be utilized to facilitate the removal of water that collects from precipitation. These sump pit are installed at both ends of the containment.

There is ice forming in the bottom of the containment confirming the integrity of the liner. This ponding of water and current forming of ice is above the cover on the bottom of the containment in some areas.

Stability

All work appears to have been completed in accordance with drawings and we have no concerns with the stability of this containment structure.

Recommendations

We currently have no recommendations with respect to this containment structure.

3.14 Quarry QMR2

General Conditions

The quarry has well defined benches. The quarry faces at the benches appear clean.

The quarry is inactive at this time but definitely not closed.

.

The area where the road was undermined in September 2015 has undergone further quarrying and the access road is gone. This area is a fractured zone and subject to subsidence as we noted while on site.

Much of the blasted rock that was in the quarry at our last visit has now been removed

Care must be taken while quarrying in the unstable fractured zone.

3.15 Crusher Pad Drainage Containment

General Conditions

Although there was no moisture flowing to the catchment pond, it is evident that the ditches in place and the containment pond are operating as intended.

Stability

The structure has been completed in accordance with drawings included in our last report in a most satisfactory manner.

Recommendations

We have no recommendations with respect to this containment structure.

3.16 Waste Stockpile Drainage Containment

Stability

The dyke appears stable at this time.

This particular structure has now been completed. The structure is in place with only minor trimming required on the inlet side. The outfall hose to pump the supernatant water over to the Mary River watershed is in place with the pump in place on the dyke.

3.17 Jet "A" Fuel Containment

General Conditions

This cell was constructed to replace the containment structure near the Weatherhaven Camp.

This cell now contains two double walled tanks and is located north of the air terminal buildings.

Stability

The cell was constructed using a one piece enviroliner with geotextile and was constructed in accordance with standardized drawings prepared in the past for such construction by our office.

There is water ponding in the form of ice in the bottom of the cell confirming the integrity of the liner.

There were no signs of cracking of the dykes. A granular ramp has been constructed over the dyke to facilitate access for snow removal.

Recommendations

We have no recommendations with respect to this structure.

3.18 Hazardous Waste Containment (MS-HW-6)

General Conditions

Although it was constructed in 2012, we first reported on it in 2015.

It is located near the incinerator and is utilized to store barrels of ash from the incinerator. It is, however, empty at this time.

Stability

The cell was constructed utilizing a one piece enviroliner with geotextile and was constructed in accordance with standardized drawings prepared in the past for such construction by our office.

There is water ponding in the bottom of the cell confirming the integrity of the liner. This water is currently in the form of ice.

There were no signs of cracking of the dykes or seepage around the exterior of the dykes.

Recommendations

We have no recommendations with respect to this structure at this time..

3.19 Overview

This report is the second phase of the eighth annual Geotechnical Inspection at Mary River and Milne Inlet completed by this author on behalf of Baffinland Iron Mines Corporation and the second year of reporting covering the second of two inspections in one shipping season.

As set out in our past reports, there has been little or no erosion taken place from wind or rain and the dykes constructed of the sand/gravel soil have remained stable at slopes of 3:1 and 4:1.

As noted last year, there are only just now signs of settlement appearing at PSWP's 1, 2 and 3. The settlements are not differential settlements of the dykes but are minor overall settlements of the total structures with respect to the surrounding area.

These settlements appear to be settlements within the one metre ± active layer above the permafrost and are of little concern as the PWSP's are temporary structures and the settlements have no effect on the dyke stability.

It is expected that many of the structures that form the basis for the inspections set out in the biannual Geotechnical inspections shall be decommissioned as the mine facilities are finalized.

A number of these structures at Mary River are awaiting the construction of a land farm facility to facilitate the disposal of contaminated granular fill from the bottom of containment cells.

4.0 MILNE INLET

4.01 General

There are still changes taking place at Milne Inlet, since our last inspection in July/August of this year.

The sediment ponds at the shore that were under nearing completion are now fully operational with inlet ditching complete.

4.02 Hazardous Waste Storage (MP-HWB-3 and MP-HWB-4)

General Conditions

This particular structure has been constructed as a two-cell structure and is now only used to store a few items.

A new hazardous waste storage facility has now been constructed near the loadout area for storing hazardous waste to be shipped out and is in full operation at this time.

Stability

There is no water ponding in both cells of the original structure. We are advised that water has been pumped from these structures and sand in the structures contains ice.

Our review of the area around the dykes, at the base of the slopes, showed no sign of seepage. The structure is considered stable.

Recommendations

We have no recommendations with respect to the use of these two cells at this time. Prior to our inspection in September, we request that water not be pumped from the structures.

4.03 Fuel Tank Farm

General Conditions

Since both 2012 and 2013 the fuel tank farm has been expanded considerably with the addition of a number of new tanks. No tanks have been added since last season but there is room to place additional tanks.

During the last day of our earlier inspections, a major fuel oil spill took place. The berm around the containment effectively contained the pill. The sumps had not been installed at the time of the spill. These sumps have been installed.

Stability

We have minor water ponding at the low end of the containment confirming the integrity of the liner. This ponding is now in the form of ice in the bottom of the containment.

Recommendations

We have no recommendations with respect to the containment at this time.

4.04 New Effluent Pond (PWSP)

General Conditions

The pond was put into operation in 2014.

The containment pond was operating at approximately sixty-percent of capacity at the time of our inspection.

Stability

We noted no sign of weakness in any of the construction.

Recommendations

We have no recommendations with respect to the use of this structure having no negative comments on the construction of this structure.

4.05 Landfarm Containment

General Conditions

The landfarm containment is complete except for soil cover on the dykes in the area of the sump.

The landfarm was constructed to accommodate approximately 9000 m^3 of oil contaminated soil and seasonal water accumulations.

At the time of our inspection the landfarm was in operation and some sorting of contaminated materials had taken place. Since our last inspection, there is still minor sorting to take place including the removal of some waste and contaminated waste.

There is still some contaminated waste in the landfarm in addition to contaminated soil. No landfarming of treated contaminated soil has taken place.

It appears as though the structure has been constructed in accordance with good construction practice for structures of this type.

Stability

The structure appears stable as constructed.

Recommendations

We recommend that the remaining dyke structure, without protective cover over it, be covered as per the design drawings. This, however, is not an absolute requirement.

4.06 Contaminated Snow Containment

General Conditions

The construction of the contaminated snow containment structure is contiguous with the east end of the landfarm.

It appears as though the structure has been constructed in accordance with good construction practice for structures of this type.

The snow containment facility has a containment volume of 929 m^3 based on estimates of snow volume provided by the owner and only a small percentage of the capacity is utilized.

The structure has been constructed with good quality control.

Stability

The structure appears stable as constructed.

Recommendations

We have no recommendations with respect to this construction at this time. The structure appears as it did in our July/August review.

4.07 Sediment Pond East

General Conditions

The construction of this sedimentation pond for drainage from the east side of the site is complete.

The basin is shaped and the liner has been installed throughout the basin from inlet to the berms on the north side of the basin.

There has been no cover placed over the liner to this point and rip rap has not yet been placed in the outlet weir.

The tears and punctures that were present at the time of our July/August review have yet to be repaired.

Stability

We still have concerns over the stability of the liner and recommend possibly tire ballast over the liner which appears possibly subject to wind damage. This shall provide a function for used tires.

Recommendations

We recommend review of the use of a ballast (possibly tires) on the exposed liner at the dyke to prevent wind uplift.

We further recommend the re-installation of the liner at the westerly Inlet such that the liner is shaped to the profile of the inlet ditch

4.08 Sediment Pond West

General Conditions

The construction of this sedimentation pond for drainage from the west side of the site is nearing completion except for the west end on the south side where the liner must be "tucked" in as set out in our report last year.

The inlet where the water was being conducted under the liner with gravel has been made good.

Stability

We have some concern over the stability of the liner on this pond as we have with the east pond and recommend the further use of tire ballast on the liner.

Recommendations

Complete construction at the inlet structures to ensure contaminated water flows into the containment and not under it. With snow conditions it was difficult to confirm the construction.

4.09 Quarry

General Conditions

The quarry was inactive at the time of our review and most blasted rock had been removed from the quarry site.

It appears that little or no quarrying has taken place since our last visit.

Stability

Rock faces appear stable.

Recommendations

We have no recommendations to be made with respect to the quarry.

4.10 Loading Area Contaminated Storage (Now MP-HWB-1)

General Conditions

This area has been constructed near the loading dock to facilitate assembly of hazardous materials for shipment out. It appears that all material from the temporary hazardous storage containment have now been assembled here.

Most hazardous waste has now been removed from the containment and shipped out.

Construction appears to have taken place in accordance with standardized drawings prepared in the past.

Stability

Construction appears stable.

Recommendations

We have no recommendations with respect to this structure.

4.13 Fueling Facility Containment

General Conditions

A new fueling facility for the fueling of B trains is completed utilizing design drawings prepared by our office.

Work conforms to the design drawing.

A second cell is now to be constructed south of the existing.

4.12 Overview

Work on containment structures is now almost complete and only the hazardous waste cells MP-HWB-3 and 4 require decommissioning.

Respectfully submitted,

Barry H. Martin, P. Eng., MRAIC

APPENDICES

SECTION 1.0 - INTRODUCTION

1.1 MARY RIVER PROJECT

The Mary River Project (the Project) is an iron ore mining project operated by Baffinland Iron Mines Corporation (Baffinland) located in the North Baffin region of Baffin Island, Nunavut. The Mary River Mine Site coordinates are approximately Latitude 71 degrees, 19' 35" North and Longitude 79 degrees 22' 30" West. Detailed descriptions of the Project and annual activities can be found in annual reports from Knight Piésold (2007b, 2008) and Baffinland (2009 to-2015, incl.).

Currently, the Tote Road is used as a means of transport for iron ore, personnel, equipment, and supplies between the Mary River Mine Site and Milne Port Site. Since 2013, there have been ongoing upgrades to sections of the road as part of the construction and operation of the Early Revenue Phase (ERP) for the Project. In order to safely and efficiently transport iron ore from the Mine Site to Milne Inlet during the early operational period of the mine, the existing Tote Road has been upgraded to accommodate and facilitate safe transit of large haul trucks and other vehicles. Work on these upgrades was initiated during the winter of 2013/14 and are still ongoing. Tote Road upgrades have included the following activities:

- Replacement of sea container crossings with free-span bridges (completed in 2014).
- Widening and twinning of the tote road at strategic locations.
- Straightening and realignment along specific road sections.
- Continued installation, movement and/or extension of culverts at identified stream crossings to improve transportation safety, minimize erosion/sedimentation, and fish passage.

As part of the response to the Fisheries Act Direction received by Baffinland from Environment and Climate Change Canada (ECCC) on June 7, 2016, Baffinland undertook various works during the summer of 2016 to minimize the potential for sedimentation and erosion. A Completion Report was submitted to ECCC on September 30 (Baffinland 2016) that summarized the actions that were taken over the summer of 2016. In addition, the Completion Report included Sedimentation and Dust Mitigation Action Plans. A critical item in the Sedimentation Mitigation Action Plan included the development and implementation of a Tote Road Earthworks Execution Plan (TREEP) to address outstanding concerns (damaged culverts, embankment erosion, etc.) along the Tote Road. The TREEP will outline timelines and measurable deliverables and will discuss the planned sedimentation mitigation measures to be completed along the Tote Road in 2017 and subsequent years.

1.2 AUTHORIZATION FOR WORKS

The Department of Fisheries and Oceans (DFO) (1998) defined Harmful Alteration, Disruption or Destruction (HADD) as, "any meaningful change in one or more habitat components that can reasonably be expected to cause a real reduction in the capacity of the habitat to support the life requisites of fish.” A HADD occurs when the physical, chemical, or biological features of a water body are sufficiently altered, such that habitat becomes less suitable for one or more life history processes of fish. Detailed descriptions of the 2007 HADD authorization (DFO File: NU-06-0084) and any related amendments and Letters of Advice can be found in previous annual reports (Knight Piésold 2007b, 2008; Baffinland 2009, 2010, 2011, 2012, 2013, 2014) and the Fish Habitat No Net Loss and Monitoring Plan is described by Knight Piésold (2007a).

A total of 25 crossings were identified (as HADD) under the August 2007 Fisheries Act Authorization, and 14 crossing were identified (as Habitat Compensation) in the August 2007 No Net Loss and Monitoring Plan. The locations of these crossings along the Tote Road are presented in Figure 1.1. Of these 25 crossings, three have since been identified as not fish-bearing and they no longer qualify as HADD sites (Baffinland 2010).

During 2016, no new Letters of Advice or Fisheries Authorizations were applied for or issued for the The Mary River Project.

1.3 REPORTING

A written report summarizing the monitoring results is to be submitted to the specified office locations of the Department of Fisheries and Oceans, Fish Habitat Management, Eastern Arctic Area, on or before December 31 of each year. Annual reports have already been submitted for the years 2007 to 2015, incl. (Knight Piésold 2007b, 2008 and Baffinland 2009, 2010, 2011, 2012, 2013, 2014, 2015).

The 2016 Annual Report, herein, covers the period of activity up to and including December 30, 2016. It summarizes the fish habitat monitoring results and provides a record for additional works or undertakings completed in accordance with the approved No Net Loss and Monitoring Plan (Knight Piésold 2007a) and conditions of the authorization, subsequent amendments, and recent Letters of Advice.

SECTION 2.0 - PROJECT DESCRIPTION

2.1 CONSTRUCTION WORK

Design summaries and descriptions of work along the Tote Road completed up to the end of 2009 are presented, in detail, in Knight Piésold (2007c) and Baffinland (2009). Recent road construction activities and installation of fish access improvement structures at some crossings are described in Baffinland (2010, 2011, 2012, 2013, 2014, and 2015).

In order to safely and efficiently transport iron ore from the Mine Site to Milne Inlet during the early operational period of the mine, the existing Tote Road has been further upgraded to accommodate the efficient and safe transit of large haul trucks and other vehicles. The first phase of the upgrades involved replacement of sea container crossings with bridges. Bridge installation was completed during the winter of 2013/14, but removal of the old sea container crossings is ongoing. Two of the four old sea can bridge crossings have been removed to date; CV 217b at km 80 and CV 128 at km 17 remain to be removed. Culvert re-installation, replacement and extension work was initiated during 2014 and also remains ongoing. Culvert installations/replacements were completed between December 2015 and the end of December 2016; however, the majority of these works occurred in non-fish-bearing streams and are, therefore, not considered further within the scope of this report. A summary of the completed work on fish bearing streams is provided in Table 2.1.

In spring 2016, Baffinland retained third party expertise, led by Golder Associates to perform work in order to mitigate erosion and sediment deposition in fisheries streams and receiving environments along the Tote Road, which contributed to the Fisheries Act Direction Baffinland received on June 7, 2016. The majority of this work focused on placing clean riprap and geo- textile fabric along strategic ditching locations that directly drained into fisheries crossings and receiving environments. The entirety of sedimentation, erosional mitigation and monitoring measures performed were summarized to ECCC, DFO, and Indigenous and Northern Affairs Canada (INAC) in six bi-weekly update reports culminating in a Completion Report submitted on September 30, 2016 (Baffinland 2016).

2.2 FISH HABITAT ASSESSMENT

Watercourses initially identified as HADD (n = 25) and compensation (n = 14) sites (Knight Piésold 2007a) were each assessed for the quality of available fish habitat at least once between 2006 and 2009 (Baffinland 2009). Detailed assessments for these sites are provided in Knight Piésold (2007b, 2008) and Baffinland (2009, 2010, 2011, 2012, 2013, 2014, 2015).

In 2016, monitoring was conducted at all fish-bearing crossings. Changes to the Tote Road included the replacement of sea container crossings with bridges (bridge installation completed during the winter of 2013/14; sea container removal ongoing), and the installation/extension of new culverts at existing crossings to accommodate road widening, straightening, and/or realignment. The emphasis of the 2016 monitoring program was to assess the presence of fish, habitat quality, and fish passage at the sites where upgrades had been completed and provide recommendations for sites yet to receive upgrades (refer to Tables 2.1 and 3.3).

Habitat surveys involved observations of substrate, gradient, flow characteristics, and potential fish use along 50 m reaches upstream and downstream of each crossing. Fish presence was determined through visual surveys and the use of a backpack electrofisher. In previous years, both methods have proven to be highly reliable techniques for determining fish presence/absence in the clear, shallow streams that are typical of the study area. Descriptions of habitat and condition of culverts were noted and photographs were taken. Results of aquatic monitoring are presented in Section 3.0.

Monitoring will continue in 2017 with descriptions of changes and potential impacts to be provided upon completion of upgrades on crossings for fish bearing streams, both historical and those to be outlined in the forthcoming TREEP (Table 2.2). It is expected that there will be some habitat gains (removal of sea container crossings) and losses (due to extension/lengthening of some existing culverts) that will need to be accounted for as work continues.

2.3 FISH HABITAT COMPENSATION

Compensation works completed for the Tote Road prior to 2009 are described in detail in Knight Piésold (2007a) and the results of recent compensation works (e.g., rustic fishway at BG-30) and detailed fish habitat and fish use surveys from 2009 to 2015 are presented in Baffinland (2009, 2010, 2011, 2012, 2013, 2014, and 2015). Following successful completion of habitat works at BG-30 (Baffinland 2012), there was a net habitat gain, which together with other gains met the compensation goals described in Knight Piésold (2007a). Fish presence upstream of the fishway in BG-30 has been confirmed during site visits from 2013-2016, indicating structural integrity and successful fish passage has been maintained.

2.4 SUMMARY OF DESIGN CHANGES

Modifications to accommodate upgrades to the Tote Road and specific water crossings to support the Early Revenue Phase of the Project that were completed in 2016 are presented in Table 2.1. Baffinland received approvals from the DFO in the form of Letters of Advice (refer to Appendix A) to proceed with these changes. As of November 30, 2015, work had been completed on the four bridge crossings and seven culvert crossings were worked on in 2015. During November 2016, CV 104 was replaced with 2 new 1.2m culverts, with clean riprap placed around the culvert ends to repair the previously damaged crossing. BG-50A, the Km 62 sea can bridge, was also removed in late November to rectify fish passage concerns. Currently the scope of planned future Tote Road crossing improvements are in development, and will be summarized in the TREEP. Baffinland Iron Mines will work with the Department of Fisheries and Oceans to ensure planned modifications to fish bearing crossings (Table 3.3) are in compliance of the federal *Fisheries Act*.

SECTION 3.0 - AQUATIC MONITORING

A monitoring plan was developed to ensure that all measures and works specified in the No Net Loss and Monitoring Plan (Knight Piésold 2007a), as well as the *Fisheries Act* Authorization and amendments, have been implemented and are functioning as intended. Details of aquatic monitoring conducted up to 2015 are provided in Knight Piésold (2007b, 2008) and Baffinland (2009, 2010, 2011, 2012, 2013, 2014, and 2015). Aquatic monitoring in 2016 focussed on assessing any changes to fish, habitat, and accessibility at fish-bearing crossings where replacement/installation of culverts occurred since November 2015.

3.1 CONSTRUCTION AND TURBIDITY MONITORING

There was no in-stream construction work in 2016 during periods of flow that required turbidity monitoring. However turbidity and flow monitoring was performed on 14 HADD crossings during June and July and August of 2016 (Table 3.1).

3.2 WATER QUALITY MONITORING OF BASELINE FISHERIES CULVERTS

Water quality monitoring data from Knight Piesold baseline monitoring work performed during 2005 and 2006, in conjunction with monitoring of the same crossings from 2015 and 2016 is presented in Table 3.2.

3.3 FISH USE ASSESSMENTS AT SELECT CROSSINGS

Fish use assessments in 2016 were conducted at all fish-bearing sites, including those where ERP upgrades had been completed by early July and those where potential future upgrades may proceed. Table 3.3 summarizes assessments conducted in 2016 and provides recommendations for future monitoring or construction works for 2017. Follow-up and corrective actions are also provided in Table 3.3, subsequent to receiving field reports from the fisheries biologist.

Five normally fish-bearing streams were dry or nearly dry in 2016, with no fish observed at the time of the survey in early July. Fish were observed at all remaining known fish-bearing crossings with generally unobstructed upstream passage through most of the culverts (Table 3.3). At the fish-bearing crossings where new construction works had been completed by early July 2016, most showed no issues with fish use of habitat or passage potential through the culverts. The old sea containers at BG-50A were becoming perched and impassable as of the early July survey and were subsequently removed in late November 2016. This should restore full access to all fish using the north channel of that stream. Removal of remaining sea containers at CV-128 and CV-217B is currently ongoing and planned to be completed by March 28, 2017.

To minimize the amount of sediment entering watercourses during freshet and damage to culverts along the Tote Road, a snow management plan with an emphasis on fish-bearing streams has been implemented to mitigate future sedimentation issues. During the Fall of 2016, fish-bearing streams were identified with roadside flags/markers. This will assist in providing visual reminders that identify fish habitat streams for routine equipment operations on the road.

Mild (e.g., CV-106) to severe (e.g., south channel at BG-50) perching of culverts has been noted at a few crossings (Table 3.3). Mild perching does not appear to have affected fish passage, but the crossing at BG-50 is sufficiently perched to prevent all upstream access for fish in the south channel, however fish passage is accessible in the north channel, especially with the removal of the perched sea can bridge at this crossing. In addition, the culverts at BG-01, though improved with the addition of a rocky ramp in 2008, are becoming increasingly perched through erosion and may become impassable in the near future. Crossings with mild perches will continue to be monitored in future years, but a Tote Road Earthworks Execution Plan (TREEP) is being developed to improve fish passage issues and erosion and sedimentation, which have been noted at several crossings (Table 3.3).

3.4 FISH USE ASSESSMENTS AT COMPENSATION SITES

All compensation works remain successful (including fish use of the rustic fishway installed at BG-30). For more details on habitat compensation activities, see Baffinland (2009, 2010, 2011, 2012, 2013, 2014, and 2015).

It is expected that there will be a reduction in the original HADD footprint size at crossings where bridges replaced sea containers and some change to the footprint size at crossings where new culverts are being installed and others replaced. Following completion of ERP upgrades and any additional works as recommended by the TREEP, HADD and compensation will be revisited to determine if sufficient compensation remains or if additional works will be required.

SECTION 4.0 - AUTHORIZED HADD CROSSING INSTALLATION SUMMARY

The locations for current authorized HADD crossings and habitat compensation sites are presented in Figure 1.1. As of November 30, 2008, all authorized HADD water crossings were installed. Remedial work up to August 2009 at the habitat compensation sites was substantially completed, and by October 2011 additional habitat compensation investigations and access structure installation were complete at select crossings. In 2012, new culverts were installed at two HADD crossings (BG-04 and BG-32) and habitat compensation works were completed at BG-30. No additional work was completed in 2013 due to pending potential upgrades to large portions of the Tote Road as part of the Early Revenue Phase of the Project. In 2013/14 bridges were installed at four crossings and culvert replacement/extension was initiated on another crossing. The now obsolete sea containers were removed from the CV-223 crossing during late fall 2014 and from BG-50 in late 2016, but have not yet been removed from two other crossings. A complete and updated list of the HADD crossings and habitat compensation sites, including crossing IDs, is provided in Table 4.1. The data in this table reflect those that were presented in detail in previous reports (Knight Piésold 2007b and 2008, Baffinland 2009), as well as the results from the most recent Tote Road surveys that were completed in 2010 (Baffinland 2010), 2011 (Baffinland 2011), 2012 (Baffinland 2012), 2013 (Baffinland 2013), 2014 (Baffinland 2014), and 2015 (Baffinland 2015).

TABLES AND FIGURES

Baffinland

Table 2.1. Summary of changes to Tote Road crossings at fish-bearing streams completed from December 1, 2015 to December 30, 2016.

Crossing	Road Chainage (km.m)	Completed Work	Current Crossing Configuration	Fisheries Survey
CV104	A33+301	• Existing culverts replaced and extended to allow widening of the road and improve fish passage.	• 2 x 1.2m diameter	• Fish observed upstream and downstream. Though fish passage was observed, the upstream end of the culvert is damaged and a little steep, which may limit passage success
BG-50	62+081	• Bridge installed to replace old sea container crossing in 2014 Sea can bridge removed in November 2016	• Bridge	• Habitat under bridge ideal for Arctic Char use (cobble/riffle); old sea containers removed to restore habitat
		• Existing culverts replaced with large diameter culverts on new road alignment in right-hand channel	• 2 x 1.2m diameter	• Culverts are perched, preventing upstream access to fish in the right-hand channel

Table 2.2. Technical summary of existing crossing structures installed at fish-bearing streams along the Tote Road.

Water Crossing	Culvert No.	Existing Road Chainage (km + m)	Existing Diameter of CSP Culverts (m) [1]							Fish Habitat Quality Rating [3]	Notes [4]
			Ø = 2.0 (m)	Ø = 1.2 (m)	Ø = 1.0 (m)	Ø = 0.5 (m)	Ø = 0.25 (m)	Ø = 0.15 (m)	Ø = 0.10 (m)		
	C	NA	-		-	X	-	-	-	IMP	-
CV186	A	A102+812	-	-	X	-	-	-	-	IMP	-
CV187	A	A102+856	-	-	-	X	-	-	-	MAR	-
	B	NA	-	-	X	-	-	-	-	MAR	-

1 – CSP = Corrugated steel pipe; Ø = culvert diameter
2 – Final length and survey culvert installation data to be provided in issued for construction drawings
3 – MAR = marginal, IMP = important
4 – New = culvert installed or worked on in 2015 or 2016 along realigned section of the road

Table 3.1. Construction and turbidity monitoring for 2016 at fish bearing crossings.

Notes:

-Monitoring results from June 2 to June 9 impacted by freshet during construction mitigation measures. Monioring results from subsequent monitoring rounds display much lower turbidity values

.-Probable minor YSI calibration calibration offset for turbidity monitoring data from August 25, however these values indicate turbidity values <1 or <0.5 NTU.

.-Physical characteristics and flow measurements not taken for every monitroing event due to equipment restrictions

.-YSI 6820 V2 and YSI PRODSS utilised for in situ turbidity monitoring data. Hach FH950 Flow Meter utilised for in situ flow monitoring data

Notes:

Yellow highlight denotes exceedance to CCME guidelines or Baffinland's 2AM-MRY-1325 Water Licence

NA denotes probable calibration error. Result not acceptable.

2006 dissolved oxygen values in mg/L; 2015 and 2016 dissolved oxygen values in % saturation

Notes:

Yellow highlight denotes exceedance to CCME guidelines or Baffinland's 2AM-MRY-1325 Water Licence

NA denotes problem with field equipment calibration, result not acceptable.

2005 and 2006 dissolved oxygen values in mg/L; 2015 and 2016 dissolved oxygen values in % saturation

Baffinland

Table 3.2 Water Quality Monitoring of Baseline Fisheries Culverts

Notes:

Yellow highlight denotes exceedance to CCME guidelines or Baffinland's 2AM-MRY-1325 Water Licence

NA denotes problem with field equipment calibration, result not acceptable.

2006 dissolved oxygen values in mg/L; 2015 and 2016 dissolved oxygen values in % saturation

Notes:

Yellow highlight denotes exceedance to CCME guidelines or Baffinland's 2AM-MRY-1325 Water Licence

2005 and 2006 dissolved oxygen values in mg/L; 2015 and 2016 dissolved oxygen values in % saturation

Baffinland

Table 3.3. Summary of fish habitat status at existing fish-bearing streams along the Tote Road in 2016.

Water Crossing No.	Fish Habitat Quality Rating [1]	New or Replaced Culverts [2]	Fish Observed during 2016 Survey	Potential Fish Passage/Habitat Issues	Detailed Observations	Recommendations and Follow-Up / Corrective Actions
CV176	MAR	Y	N	N	Water levels during survey were very low, providing no habitat near the crossing.	Note that there is no natural fish habitat upstream of these crossings, regardless of water level, so passage is unnecessary, but must make sure there are no downstream effects. To be monitored in 2017.
CV169	MAR	Y	N	N	Water levels during survey were very low, providing no habitat near the crossing.	None
CV167	MAR	N	N	N	Water levels during survey were very low, providing no habitat near the crossing.	Remove culvert on old road or ensure steaming for passage. To be completed during 2017.
CV129	IMP	Y	Y	Y	Fish observed upstream and downstream. Culvert badly damaged with pieces in the water upstream. Road dust coating much of the substrate in the vicinity of the crossing as with all crossings.	Clean up culvert debris and monitor passage in case damaged culvert becomes a larger issue. These recommendations implemented later in July and August 2016.
CV128	IMP	Bridge Only	Y	N	Fish observed upstream and downstream. No issues with passage or habitat, though old sea containers still need to be removed.	Remove old sea containers. Scheduled to be removed by end of March 2017.
CV114	MAR	N	Y	Y	Culverts damaged with debris instream; may eventually affect passage Left culvert (looking US) has become slightly perched; right culvert OK.	Remove culvert debris and closely monitor passage in both culverts. Debris was removed during July and August 2016. Culvert to be targeted as part of the 2017 TREEP.
CV112	IMP	N	Y	Y	Fish observed upstream and downstream. Right-hand culvert (looking US) has been obliterated and may currently be obstructing some movement.	This culvert will need to be repaired or replaced if it is to continue allowing unobstructed passage. This culvert is to be targeted as part of the 2017 TREEP.

Table 3.3. Summary of fish habitat status at existing fish-bearing streams along the Tote Road in 2016.

Water Crossing No.	Fish Habitat Quality Rating [1]	New or Replaced Culverts [2]	Fish Observed during 2016 Survey	Potential Fish Passage/Habitat Issues	Detailed Observations	Recommendations and Follow-Up / Corrective Actions
CV111	IMP	N	Y	N	Fish observed upstream and downstream. No passage issues.	None
CV106	MAR	N	Y	Y	Fish observed downstream. Culvert has become perched and may be affecting fish passage.	The perch is likely to worsen; will need to reinstall or build up downstream habitat. This culvert is to be targed as part of the 2017 TREEP.
CV104	MAR	Y	Y	Y	Fish observed upstream and downstream. Though fish passage was observed, the upstream end of the culvert is damaged and a little steep, which may limit passage success.	Repair culvert to prevent culvert becoming problem for fish passage. This culvert was replaced during the Fall 2016.
CV102	IMP	N	N	N	Current water levels too low for fish. No stranding issues this year.	None
CV099	IMP	Y	Y	Y	Fish observed upstream and downstream. Right culvert is starting to become perched.	Closely monitor culvert for any worsening of the perch. May need to properly reinstall or mitigate with a fish ladder if perch increases. This culvert is to be targeted as part of the 2017 TREEP.
CV087	MAR	N	N	N	Stream dry or nearly dry at time of visit. No fish observed. Culverts should not affect passage during high water periods, when fish have access to the crossing.	None
CV080	IMP	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None
CV079	IMP	N	Y	N	Fish observed upstream and downstream. No issues with stranding.	None
CV078	IMP	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None

Table 3.3. Summary of fish habitat status at existing fish-bearing streams along the Tote Road in 2016.

Water Crossing No.	Fish Habitat Quality Rating [1]	New or Replaced Culverts [2]	Fish Observed during 2016 Survey	Potential Fish Passage/Habitat Issues	Detailed Observations	Recommendations and Follow-Up / Corrective Actions
CV076	MAR	N	Y	N	Fish observed upstream and downstream. No issues with passage.	None
CV072	IMP	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None
CV071	MAR	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None
CV060	IMP	N	Y	N	Fish observed upstream and downstream. Culvert a little perched.	None
CV059	MAR	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None
CV058	MAR	N	Y	Y	Fish observed upstream and downstream. Culverts are getting crushed, which could affect future passage.	Repair or replace culverts. This culvert to be targeted as part of the 2017 TREEP.
CV057	MAR	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None
BG50	IMP	Y	Y	Y	Fish observed upstream and downstream. Culverts in right-hand channel are completely impassable due to very high perch. Old sea container crossing is becoming increasingly perched, limiting passage to larger juveniles in the left-hand channel.	Old sea containers were removed in late November 2016. Habitat improvement will be confirmed in 2017. Culverts in the right-hand channel will need to be re-installed and properly embedded. This culvert is being targeted as part of the 2017 TREEP.
CV049	IMP	N	Y	Y	Fish observed upstream and downstream. No issues with passage or habitat.	None

Baffinland

Table 3.3. Summary of fish habitat status at existing fish-bearing streams along the Tote Road in 2016.

Water Crossing No.	Fish Habitat Quality Rating [1]	New or Replaced Culverts [2]	Fish Observed during 2016 Survey	Potential Fish Passage/Habitat Issues	Detailed Observations	Recommendations and Follow-Up / Corrective Actions
CV030	MAR	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None
BG32	IMP	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None
CV217	IMP	Y	Y	N	Fish observed upstream and downstream. No issues with passage or habitat, though old sea containers should be removed at the earliest convenience.	Remove old sea containers
CV216	MAR	N	Y	Y	Fish observed downstream only. Culvert becoming perched and YOY that use this stream will not have access US habitat if they don't already.	May need to properly reinstall or mitigate with a fish ladder if perch increases. This crossing is being targeted as part of the 2017 TREEP.
BG30	IMP	N	Y	N	Fish observed upstream and downstream. Passage is confirmed, but the fish ladder will need to be monitored annually for any changes.	Fish ladder functioning, but will need regular monitoring and possible modifications if culvert perches more.
BG29	IMP	N	Y	Y	Fish observed upstream and downstream. No issues with passage, but a large mound of apparent road sediment is present in the stream	This sediment will likely be washed DS during next high flow event; but it needs to be prevented in the future. The immediate sedimentation issue was addressed during July 2016. The culvert will be targeted for long term mitigation as part of the 2017 TREEP.
BG27	MAR	N	Y	Y	Fish observed downstream only. A rocky barrier was placed downstream of the culvert preventing all fish access.	Remove the rocky barrier. This culvert will be targeted as part of the 2017 TREEP.
BG24	IMP	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None

Baffinland

Table 3.3. Summary of fish habitat status at existing fish-bearing streams along the Tote Road in 2016.

Water Crossing No.	Fish Habitat Quality Rating [1]	New or Replaced Culverts [2]	Fish Observed during 2016 Survey	Potential Fish Passage/Habitat Issues	Detailed Observations	Recommendations and Follow-Up / Corrective Actions
BG17	IMP	N	Y	Y	Fish observed upstream and downstream. No issues with passage, but a large, unnatural mound of reddish, metallic clay observed US.	May need to remove the foreign clay. The immediate sedimentation issue was addressed during July 2016. The culvert and upstream sources of this material will be targeted for long term mitigation as part of the 2017 TREEP.
BG04	IMP	N	Y	N	Fish observed upstream and downstream. No issues with passage or habitat.	None
CV001	IMP	Y	Y	N	Fish observed downstream only due to very low water levels near the crossing. No issues with passage or habitat at normal water levels.	None
CV223	IMP	N	Y	Y	Fish observed upstream and downstream. No issues with passage, but culverts are getting damaged and some debris is accumulating instream.	Remove debris and repair or replace culverts. The immediate sedimentation issue was addressed during July 2016. This culvert will be targeted as part of the 2017 TREEP.
CV224	IMP	N	Y	Y	Fish observed upstream and downstream. No issues with passage, but road debris (plastic reflective posts) in the water.	Road debris was in the water around the culvert. The immediate debris issue was addressed during July 2016. This culvert will be targeted as part of the 2017 TREEP
CV225	IMP	Y	Y	Y	Fish observed upstream and downstream. New culvert installation is currently okay, but there is potential for perching. Right culvert blocked by sediment or ice at the time of survey.	Culvert blockage may need to be removed. This condition is to be monitored during 2017.
BG01	IMP	N	Y	Y	Fish observed upstream and downstream. Culvert remains perched, making passage during periods of high velocity or low water difficult, particularly for smaller juveniles. Rocky ramp remains intact, but any change will likely prevent all passage.	This crossing needs one or two properly embedded, larger culverts to replace the existing ones. Continue to closely monitor for change. This culvert will be targeted as part of the 2017 TREEP

Table 3.3. Summary of fish habitat status at existing fish-bearing streams along the Tote Road in 2016.

Water Crossing No.	Fish Habitat Quality Rating [1]	New or Replaced Culverts [2]	Fish Observed during 2016 Survey	Potential Fish Passage/Habitat Issues	Detailed Observations	Recommendations and Follow-Up / Corrective Actions
CV186	IMP	N	Y	Y	Fish observed downstream only. Though there are no issues with passage through the culvert, there is a layer of road sediment covering the substrate within at least 50 m of the crossing upstream and downstream - this smothering of the substrate may be affecting fish use of this stream during the late summer feeding period. There has been improvement in this issue since 2015, but more needs to be done.	Diligent dust control in the vicinity of this crossing and higher, rip-rapped road embankments may alleviate much of the deposition. Spring freshet may also transport loose materials downstream into Sheardown Lake. The immediate sedimentation issue was addressed during July and August 2016. This culvert will be targeted as part of the 2017 TREEP
CV187	MAR	N	N	Y	Though there are no issues with passage through the culvert, there are similar road sediment issues as for CV187 In addition, there is a flow meter station immediately upstream of the culvert that is completely blocking any further movements of fish.	Similar recommendations to CV-186; and remove or modify the flow meter station to allow passage. The immediate sedimentation and fish passage issues were addressed during July and August 2016. This culvert will be targeted as part of the 2017 TREEP

1 - Habitat status assessed for current crossings prior to pending upgrades; NFB = not fish-bearing, MARG = marginal, IMP = important
2 - Fish habitat status assessed for new (2015 and 2016) crossings following road upgrades; NC = no change

Dear Mr. Curran:

Subject: Proposal not likely to result in impacts to fish and fish habitat.

Fisheries and Oceans Canada – Fisheries Protection Program (DFO) received your proposal on August 29, 2013. Please refer to the file number and title below:

DFO File No.: **07-HCAA-CA7-00050**
Title: **Mary River Iron Ore Project, Baffin Island (Baffinland), Nunavut**

You may be aware of changes to the *Fisheries Act*, however these have not affected the review of your project at this time. For more information on current changes to the *Fisheries Act* please refer to the DFO website at www.dfo-mpo.gc.ca/media/infocus-alaune/2012/habitat-eng.htm.

Your proposal has been reviewed to determine whether it is likely to result in impacts to fish and fish habitat which are prohibited by the habitat protection provisions of the *Fisheries Act* or those prohibitions of the *Species at Risk Act* that apply to aquatic species.*

Our review consisted of:

Changes to Culverts along the Tote Road, Submission dated August 29, 2013 from Oliver Curran - Baffinland Iron Mines Corporation

Freshwater Aquatic Baseline Synthesis Report 2005-2011 (January 2012), Baffinland Iron Mines Corporation, Mary River Project, Prepared by North/South Consultants Inc.

*Those sections most relevant to the review of development proposals include 20, 22, 32 and 35 of the *Fisheries Act* and sections 32, 33 and 58 of the *Species at Risk Act*. For more information please visit www.dfo-mpo.gc.ca.

Canada

We understand that you propose to carry out the following culvert upgrades along the Tote Road:

Culvert ID	Proposed Culvert Diameter (m)	Proposed Culvert Length (m)	Area of Rip Rap (m2)	Proposed Culvert Upgrate
BG31A	1.2	19.5	24.96	Extend 1m left & 2.5m right
BG30	1	22	17.33	Extend 7m right
BG29	1	31	0	Extend 7.5m left & 8.5m right
BG27B	0.5	31	4.33	Extend 5m left & 8m right
BG27C	0.5	31	0	Extend 5m left & 8m right
BG27A	0.5	31	0	Extend 4.5m left & 8.5m right
BG17A	1.2	36.5	24.96	Extend 8m left & 13.5m right
BG17B	1.2	37.5	24.96	Extend 15.5m left & 7m right
BG04A	1.2	24	0	Extend 5.5m left & 3.5m right
BG04B	1.2	24	0	Extend 5m left & 4m right
CV224A	1	26	0	Extend 6m left & 5m right
CV224B	1	26.5	0	Extend 6.5m left & 5m right
CV225B	1.2	18	0	Replace with new length of 18m
CV225A	1	18.5	17.33	Replace with new length of 18.5m
BG01C	1.2	37	24.96	Extend 11m left & 8m right
BG01A	1.2	36.5	24.96	Extend 11.5m left & 7m right
BG01B	1.2	37	24.96	Extend 12m left & 7m right
BG01D	0.5	10	0	New Culvert
BG01F	0.5	18	0	New Culvert
BG01E	1.0	10	0	New Culvert
BG01G	0.5	23	0	New Culvert
CV186	1	27	0	Extend 6m left
CV187A	0.5	20.5	0	Extend 6m left & 4.5m right
CV187B	0.5	16	0	New Culvert
CV166A	1	23.5	17.33	Extend 8.5m right
CV166B	0.5	22.5	0	Extent 7.5m right
CV115A	0.5	17.5	0	Extend 2.5m left
CV115B	1	17	0	Extend 2m left

Provided that your plans are implemented as described DFO has concluded that your proposal is not likely to result in impacts to fish and fish habitat.

You will not need to obtain a formal approval from DFO in order to proceed with your proposal.

If the plans have changed or if the description of your proposal is incomplete you should contact this office to determine if the advice in this letter still applies.

Please be advised that any unauthorized impacts to fish and fish habitat which result from a failure to implement this proposal as described could lead to corrective action such as enforcement.

If you have any questions please contact the undersigned at (867) 669-4927 or by email at Georgina.Williston@dfo-mpo.gc.ca.

Yours sincerely,

Georgina Williston

Dear Mr. Curran:

Subject: Implementation of mitigation measures to avoid and mitigate serious harm to fish.

The Fisheries Protection Program (the Program) of Fisheries and Oceans Canada received your proposal on August 28, 2013.

Your proposal has been reviewed to determine whether it is likely to result in serious harm to fish which is prohibited under subsection 35(1) of the *Fisheries Act.*

Our review consisted of:

Baffinland Submission: Tote Road Upgrade-Four Seacan Bridge Replacements, Tote Road Upgrade- Fish Bearing Culvert submission, Attachments 1 &2, August 2013.

We understand that you propose to: Upgrade the following crossings along the Tote Road.

The following seacan crossings will be removed and replaced with clear span bridges

- STA 17 (CV 128)
- STA 62 (BG50)
- STA 80 (CV 217)
- STA 97 (CV223)

The following culvert crossings will be upgraded as follows:

Culvert ID	Proposed Culvert Diameter (m)	Proposed Culvert Length (m)	Area of Rip Rap (m2)	Proposed works to be completed
CV217B	1.2	16	24.96	Extend 1m right
CV217C	1.2	16	24.96	Extend 1m right
CV217A	1.2	16	24.96	Extend 1m right
CV217D	0.15		0	Abandon
CV216B	1.2	17.5	0	Extend 1.5m left & 1m right
CV216C	1.2	16.5	0	Extend 1.5m left
CV216A	1.2	18.5	0	Extend 1.5m left & 2m right
CV216D	0.5	14.5	0	Replace with new length of 14.5m
CV216E	0.5	14	0	Abandon and replace with new length of 14m
CV216F	0.5	12	0	Replace with new length of 12m
CV223B	1.2	28	24.96	Extend 13m left
CV223C	1.2	28	24.96	Extend 13m left
CV223D	1.2	29	24.96	Extend 14m left
CV223A	2	24	69.33	Extend 14m left
CV223E	1.2	19.5	0	Extend 4.5m left
CV223F	1.2	19	0	Extend 4m left
CV115C	0.5	15.5	0	Extend 3.5m right
CV115D	0.5	17	4.33	Extend 8m left
CV114A	1	15.5	17.33	Extend 0.5m right
CV114B	0.5	14	0	Extend 5m left
CV114C	0.5	11	4.33	Replace with new length of 11m
CV114D	0.5	11.5	4.33	Extend 2m left & 0.5m right
CV112A	1.2	17.5	24.96	Extend 2.5m right
CV112B	0.5	24	0	Extend 9m right
CV112C	0.5	21	4.33	Extend 9m left
CV111	1	24	17.33	Extend 4.5m left & 1.5m right
CV106	1	19	17.33	Extend 4m left
CV104A	1.2	19	24.96	Extend 4m left
CV104B	1.2	19	24.96	Extend 4m left
CV102A	1	22.5	17.33	Extend 7.5m left
CV102B	0.5	21.5	0	Extend 6.5m left
CV102C	0.5	21.5	0	Extend 6.5m left
CV102D	0.5	20.5	0	Extend 5.5m left
CV099B	1.2	17	24.96	Replace with new length of 17m

.../4

To avoid the potential of serious harm to fish and their habitat, we are recommending that the following mitigation measures be included into your plans.

- If in-stream work is required during the open water season it should be completed in the dry by de-watering the work area and diverting and/or pumping flows around cofferdams placed at the limits of the work area.
- Existing stream flows should be maintained downstream of the de-watered work area without interruption, during all stages of the work.
- A fish stranding program should be implemented if necessary by a qualified fisheries person , who is experienced in this area, immediately following isolation and prior to de-watering to ensure that fish are removed from any dewatered area and released alive immediately downstream of the work area.
- Flow dissipaters and/or filter bags, or equivalent, should be placed at water discharge points to prevent erosion and sediment release.
- Silt or debris that has accumulated around the temporary cofferdams should be removed prior to their withdrawal.

Provided that these mitigation measures are incorporated into your plans, the Program is of the view that your proposal will not result in serious harm to fish. No formal approval is required from the Program under the *Fisheries Act* in order to proceed with your proposal.

If your plans have changed or if the description of your proposal is incomplete, or changes in the future, you should consult our website (http://www.dfo-mpo.gc.ca/pnw-ppe/index-eng.html) or consult with a qualified environmental consultant to determine if further review is required by the Program.

Please notify this office at least 10 days before starting your project. A copy of this letter should be kept on site while the work is in progress.

If you have any questions, please contact Georgina Williston at our Yellowknife office at 867-669-4927, by fax at 867-669-4940 or by email at geogina.williston@dfo-mpo.gc.ca. Please refer to the file number referenced above when corresponding with the Program.

James Millard
Environmental Manager
Baffinland Iron Mines Corp.
275 Upper Middle Road East Suite 300
Oakville, ON L6H 0C3

Dear Mr. Millard:

Subject: Implementation of mitigation measures to avoid and mitigate serious harm to fish – Mary River Project, Tote Road Realignment.

The Fisheries Protection Program of Fisheries and Oceans Canada received your proposal on February15, 2015.

Your proposal has been reviewed to determine whether it is likely to result in serious harm to fish which is prohibited under subsection 35(1) of the *Fisheries Act*.

Your proposal has also been reviewed to determine whether it will adversely impact listed aquatic species at risk and contravene sections 32, 33 or 58 of the *Species at Risk Act* (*SARA*).

Our review considered the following:

- Letter from Baffinland Iron Mines Re: Mary River Project – Request for Advice on Realignment of Tote Road at Culvert CV076, Km 53 Tote Road, DFO File dated February 15, 2015 and submitted by James Millard with 1 attachment.
- Attachment 1 - Mark-up of proposed field change, Drawing H349000-3000-10-012-0073

We understand that you propose to:

- Realign the existing Tote Road at Culvert CV076, 160 meters upstream from the existing crossing and install one culvert which is 1.2m in diameter and 18 m in length.
- Install culverts during the winter months when the stream is frozen to bottom.
- Remove existing culvert from the old Tote Road alignment.

Since there are no *SARA* species or their habitats identified in the project area, no additional approvals under *SARA* will be required for your proposed activities.
To avoid the potential for serious harm to fish that is prohibited under the *Fisheries Act*, the mitigation measures set out in your project plans are to be followed.

Provided that you implement the required mitigation measures for your project, and follow the guidance available on the DFO website at http://www.dfo-mpo.gc.ca/pnw-ppe/measures-mesures/index-eng.html, the Program is of the view that your proposal should not result in serious harm to fish or contravene sections 32, 33 or 58 of the *Species at Risk Act*. No formal approval is required from the Program under the *Fisheries Act* or the *Species at Risk Act* in order to proceed with your proposal.

It remains your responsibility to ensure you avoid causing serious harm to fish in compliance with the *Fisheries Act*, and that you meet the requirements under the *Species at Risk Act* as it may apply to your project. If your plans have changed or if the description of your proposal is incomplete, or changes in the future, you should consult our website (http://www.dfo-mpo.gc.ca/pnw-ppe/index-eng.html) or consult with a qualified environmental consultant to determine if further review is required by the Program.

Please be advised that it is also your *Duty to Notify* DFO if you have caused, or are about to cause, serious harm to fish that are part of or support a commercial, recreational or Aboriginal fishery. Such notifications should be directed to http://www.dfo-mpo.gc.ca/pnw-ppe/violation-infraction/index-eng.html.

A copy of this letter should be kept on site while the work is in progress. It remains your responsibility to meet all other federal or territorial requirements that apply to your project.

If you have any questions, please contact Georgina Williston at our Yellowknife office at (867) 669-4927, by fax at (867) 669-4940, or by email at georgina.williston@dfo-mpo.gc.ca. Please refer to the file number referenced above when corresponding with the Program.

Yours sincerely,

Julie Dahl

Dear Mr. Millard:

Subject: Implementation of mitigation measures to avoid and mitigate impacts to fish and fish habitat and listed aquatic species at risk – Mary River Project

The Fisheries Protection Program (the Program) of Fisheries and Oceans Canada received your proposal on November 27, 2014.

Your proposal has been reviewed to determine whether it is likely to result in serious harm to fish which is prohibited under subsection 35(1) of the *Fisheries Act*.

Your proposal has also been reviewed to determine whether it will adversely impact listed aquatic species at risk and contravene sections 32, 33 or 58 of the *Species at Risk Act* (*SARA*).

Our review considered the following:

- Letter from Baffinland Iron Mines RE: Realignment of Tote Road at Culvert CV099. Dated November 27, 2014 and submitted by James Millard, with 1 attachment.
- Attachment 1- Mark up of proposed field change, Drawing H349000-3000-10-012-0052

We understand that you propose to:

- Realign the existing Tote Road and install one 2 metre diameter culvert in the stream bed and two 1.2 metre overflow culverts. Culverts will be approximately 27 metres in length.

- Install culverts during the winter months when the stream is frozen to bottom.
- Remove existing culverts along the old Tote Road alignment.

Since there are no *SARA* species or their habitats identified in the project area, no additional approvals under *SARA* will be required for your proposed activities.

To avoid the potential for serious harm to fish that is prohibited under the *Fisheries Act*, the mitigation measures set out in your project plans are to be followed.

Provided that you implement the required mitigation measures for your project, and follow the guidance available on the DFO website at http://www.dfo-mpo.gc.ca/pnw-ppe/measures/index-eng.html, the Program is of the view that your proposal should not result in serious harm to fish or contravene sections 32, 33 or 58 of the *Species at Risk Act*. No formal approval is required from the Program under the *Fisheries Act* or the *Species at Risk Act* in order to proceed with your proposal.

It remains your responsibility to ensure you avoid causing serious harm to fish in compliance with the *Fisheries Act*, and that you meet the requirements under the *Species at Risk Act* as it may apply to your project. If your plans have changed or if the description of your proposal is incomplete, or changes in the future, you should consult our website (http://www.dfo-mpo.gc.ca/pnw-ppe/index-eng.html) or consult with a qualified environmental consultant to determine if further review is required by the Program.

Please be advised that it is also your *Duty to Notify* DFO if you have caused, or are about to cause, serious harm to fish that are part of or support a commercial, recreational or Aboriginal fishery. Such notifications should be directed to http://www.dfo-mpo.gc.ca/pnw-ppe/violation-infraction/index-eng.html.

A copy of this letter should be kept on site while the work is in progress. It remains your responsibility to meet all other federal or territorial requirements that apply to your project.

If you have any questions, please contact Georgina Williston at our Yellowknife office at 867-669-4927 or by email at Georgina.Williston@dfo-mpo.gc.ca. Please refer to the file number referenced above when corresponding with the Program.

Dear Mr. Millard:

Subject: Implementation of mitigation measures to avoid and mitigate impacts to fish and fish habitat and listed aquatic species at risk – Mary River Project

The Fisheries Protection Program (the Program) of Fisheries and Oceans Canada received your proposal on October 17, 2014.

Your proposal has been reviewed to determine whether it is likely to result in serious harm to fish which is prohibited under subsection 35(1) of the *Fisheries Act*.

Your proposal has also been reviewed to determine whether it will adversely impact listed aquatic species at risk and contravene sections 32, 33 or 58 of the *Species at Risk Act* (*SARA*).

Our review considered the following:

- Letter from Baffinland Iron Mines RE: Realignment of Tote Road at Culvert CV225B. Dated October 16, 2014 and submitted by James Millard, with 2 attachments.
- Attachment 1- Mark of proposed field change, Drawing H349000-3000-10-012-0139
- Attachment 2- Project Wide, Civil Standard Drawing, Typical Culvert Detail, H349000-1000-10-041-0003

We understand that you propose to:

- Realign the existing Tote Road and install two new 1.2 metre culverts in the stream bed and one 1.0 metre culvert 45 m away as an overflow. Culverts will be approximately 27metres in length.

- Install culverts during the winter months when the stream is frozen to bottom.
- Remove the two existing 1.2m culverts along the old Tote Road alignment.

Since there are no *SARA* species or their habitats identified in the project area, no additional approvals under *SARA* will be required for your proposed activities.

To avoid the potential for serious harm to fish that is prohibited under the *Fisheries Act*, the mitigation measures set out in your project plans are to be followed.

Provided that you implement the required mitigation measures for your project, and follow the guidance available on the DFO website at http://www.dfo-mpo.gc.ca/pnw-ppe/measures/index-eng.html, the Program is of the view that your proposal should not result in serious harm to fish or contravene sections 32, 33 or 58 of the *Species at Risk Act*. No formal approval is required from the Program under the *Fisheries Act* or the *Species at Risk Act* in order to proceed with your proposal.

It remains your responsibility to ensure you avoid causing serious harm to fish in compliance with the *Fisheries Act*, and that you meet the requirements under the *Species at Risk Act* as it may apply to your project. If your plans have changed or if the description of your proposal is incomplete, or changes in the future, you should consult our website (http://www.dfo-mpo.gc.ca/pnw-ppe/index-eng.html) or consult with a qualified environmental consultant to determine if further review is required by the Program.

Please be advised that it is also your *Duty to Notify* DFO if you have caused, or are about to cause, serious harm to fish that are part of or support a commercial, recreational or Aboriginal fishery. Such notifications should be directed to http://www.dfo-mpo.gc.ca/pnw-ppe/violation-infraction/index-eng.html.

A copy of this letter should be kept on site while the work is in progress. It remains your responsibility to meet all other federal or territorial requirements that apply to your project.

TABLE OF CONTENTS

LIST OF TABLES

LIST OF APPENDICES

1. INTRODUCTION

Baffinland Iron Mines Corporation (Baffinland) is committed to remediating areas impacted by current exploration and production activities at their sites on Baffin Island. In order to comply with this objective, Qikiqtaaluk Environmental (QE) was retained to provide on-site repackaging and off-site disposal of hazardous waste from Steensby Inlet, Mary River and Milne Inlet for the 2016 season. From August 17 to September 1, 2016, QE provided Environmental Quality Assurance Specialists to ensure that the on-site repackaging, identification, labelling, and documentation of hazardous waste for off-site shipment met applicable regulatory requirements. The work was carried out at 3 locations: Steensby Inlet, Mary River and Milne Inlet. Photographs of the on-site waste staging are presented in Appendix A.

2. TRANSPORT AND DISPOSAL

Hazardous waste from the Baffinland sites was shipped via 2 different sealifts.

The first vessel departed Steensby Inlet on August 30, 2016 and arrived at the Port of Valleyfield on September 7 ,2016. The second vessel departed Milne Inlet on September 29, 2016 and arrived at the Port of Valleyfield on October 4, 2016.

At the Port of Valleyfield, hazardous materials from the 2 vessels were managed by QE on behalf of Baffinland before being transported to *MDDELCC*[1] authorized disposal facilities.

Waste materials were transported to *Solva-Rec Environnement Inc.* (*Solva-Rec*), *Campor Environnement Inc.* (*Campor*), and Delsan-AIM Environmental Services Inc., all registered disposal facilities located in the Province of Quebec.

Environmental Compliance Documentation

Ministère du Développement durable, de l'Environnement et des Parcs
Québec

Longueuil, le 8 septembre 2009

PERMIS

Solva-Rec Environnement inc.
420, boulevard Industriel
Saint-Jean-sur-Richelieu (Québec) J3B 4S6

N/Réf. : 7610-16-01-1060901
400631521

Objet : Exploitation d'un centre de gestion de matières dangereuses résiduelles

Mesdames,
Messieurs,

À la suite de votre demande de permis datée et reçue le 23 mars 2009, complétée le 1er septembre 2009, je délivre au titulaire ci-dessus mentionné, conformément à l'article 70.11 de la *Loi sur la qualité de l'environnement* (L.R.Q., chapitre Q-2), le présent permis d'exploitation à l'égard des activités ci-dessous :

- Entreposage d'une quantité maximale de 714 300 kg de matières dangereuses résiduelles appartenant aux catégories mentionnées à l'annexe 4 du *Règlement sur les matières dangereuses* à l'exception des matières explosives ou radioactives;
- Neutralisation d'isocyanates;
- Neutralisation d'acides et de bases;
- Broyage de néons et de contenants de matières dangereuses résiduelles;
- Vidange de contenants aérosols;
- Nettoyage de contenants et de pièces contaminées;
- Consolidation de matières dangereuses résiduelles semi-liquides.

Ces activités seront réalisées sur les lots 239 et 241 du cadastre de la paroisse de Saint-Athanase et dont l'adresse civique est le 795 rue Lucien-Beaudin à Saint-Jean-sur-Richelieu dans la municipalité régionale de comté du Haut-Richelieu.

Les documents suivants font partie intégrante du présent permis d'exploitation :

- Lettre au ministère du Développement durable, de l'Environnement et des Parcs, datée du 23 mars 2009, signée par Hughes Lamer, concernant la demande de permis d'exploitation, 16 pages et 5 annexes;

- Lettre au ministère du Développement durable, de l'Environnement et des Parcs, datée du 25 juin 2009, signée par Hughes Lamer concernant la demande de permis d'exploitation, 16 pages et 1 annexe;

- Courriels datés des 28 août, 31 août et 1er septembre 2009, envoyés par Hughes Lamer et concernant des informations additionnelles relativement à de la demande de permis.

En cas de divergence entre ces documents, l'information contenue au document le plus récent prévaudra.

Le projet devra être exploité conformément à cette demande de permis d'exploitation et à ces documents.

Ce permis d'exploitation est valide pour une durée de cinq ans à compter du 1er octobre 2009.

En outre, ce permis d'exploitation ne vous dispense pas d'obtenir toute autre autorisation requise par toute loi ou tout règlement, le cas échéant.

Pour la ministre,

PP/JL/jl

Pierre Paquin
Directeur régional
de l'analyse et de l'expertise
de l'Estrie et de la Montérégie

SECTION 2

IDENTIFICATION DE LA MATIÈRE DANGEREUSE

L'identification d'une matière dangereuse est déterminée par le code de sa catégorie, indiqué à la section 1 de la présente annexe, accompagné des numéros de sa classe et de sa division, tels qu'attribués en vertu du Règlement sur le transport des matières dangereuses (D. 866-2002, 02-07-10) (si la matière dangereuse n'est pas visée par ce dernier règlement, on utilisera alors le code 0.0), ainsi que par le code indiquant son état physique tel que déterminé selon le tableau suivant:

Code	État physique
L	Liquide
S	Solide
P	Semi-solide (boue)
G	Gazeux

D. 1310-97, ann. 4.

Ministère
du Développement durable,
de l'Environnement
et de la Lutte contre les
changements climatiques
Québec

Longueuil, le 8 septembre 2014

PERMIS
Loi sur la qualité de l'environnement
(RLRQ, chapitre Q-2, article 70.11)

Solva-Rec Environnement Inc.
795, rue Lucien-Beaudin
Saint-Jean-sur-Richelieu (Québec) J2X 5M3

N/Réf. : 7610-16-01-1060901
401172445

Objet : Exploitation d'un centre de gestion de matières dangereuses résiduelles

Mesdames,
Messieurs,

À la suite de votre demande de renouvellement de permis du 24 mai 2014, reçue le 3 juin 2014 et complétée le 5 septembre 2014, je délivre au titulaire mentionné ci-dessus, conformément à l'article 70.11 de la *Loi sur la qualité de l'environnement* (RLRQ, chapitre Q-2), le permis à l'égard de l'activité décrite ci-dessous :

- Entreposage d'une quantité maximale de 2 713 425 kg de matières dangereuses résiduelles appartenant aux catégories mentionnées à l'annexe 4 du *Règlement sur les matières dangereuses* à l'exception des matières explosives ou radioactives;
- Neutralisation d'isocyanates;
- Neutralisation d'acides et de bases;
- Broyage de néons et de contenants de matières dangereuses résiduelles;
- Vidange de contenants aérosols;
- Nettoyage de contenants et de pièces contaminées;
- Consolidation de matières dangereuses résiduelles semi-liquides.

Ce projet est situé à l'emplacement mentionné ci-après :

> Sur le lot 4 043 276 du cadastre du Québec (anciennement les lots 239 et 241 du cadastre officiel de la paroisse de Saint-Athanase), municipalité régionale de comté du Haut-Richelieu, dont l'adresse civique est le 795, rue Lucien-Beaudin, dans la municipalité de Saint-Jean-sur-Richelieu.

Les documents suivants font partie intégrante du présent permis :

- Lettre et documents transmis au ministère du Développement durable, de l'Environnement et de la Lutte contre les changements climatiques, datée du 24 mai 2014 et signée par Hugues Lamer, concernant la demande de renouvellement de permis;
- Courriel transmis le 3 septembre 2014 au ministère du Développement durable, de l'Environnement et de la Lutte contre les changements climatiques par Éric Benoît, concernant des précisions sur les activités d'entreposage effectuées à l'extérieur et sur des informations techniques;
- Lettre et documents transmis le 5 septembre 2014 au ministère du Développement durable, de l'Environnement et de la Lutte contre les changements climatiques par Hugues Lamer, concernant des informations techniques et les engagements du détecteur de COV, des registres et de l'entreposage de MDR à l'extérieur sur le terrain.

En cas de divergence entre ces documents, l'information contenue au document le plus récent prévaudra.

Le projet devra être réalisé et exploité conformément à ces documents.

Ce permis est valide pour cinq ans à compter du 8 septembre 2014, conformément à l'article 70.14 de ladite loi.

En outre, ce permis ne dispense pas le titulaire d'obtenir toute autre autorisation requise par toute loi ou tout règlement, le cas échéant.

Pour le ministre,

PP/AM/am

Pierre Paquin
Directeur régional de l'analyse et de l'expertise de l'Estrie et de la Montérégie

Objet : Système de gestion de transport de matières dangereuses résiduelles

Mesdames,
Messieurs,

À la suite de votre demande de renouvellement de permis datée du 7 août 2011, reçue le 18 août 2011 et complétée le 23 novembre 2011, je délivre au titulaire ci-dessus mentionné, conformément aux articles 70.9-5 et 70.14 de la *Loi sur la qualité de l'environnement* (L.R.Q., chapitre Q-2), le permis à l'égard de l'activité ci-dessous :

> Transport de matières dangereuses résiduelles vers un lieu d'élimination. Les matières dangereuses résiduelles transportées seront solides, liquides ou semi solides et appartiendront aux catégories mentionnées à l'annexe 4 du *Règlement sur les matières dangereuses* à l'exception des matières et objets contenant des BPC et des matières explosives ou radioactives.

Les véhicules servant au transport de matières dangereuses résiduelles seront remisés à l'adresse suivante :

795, rue Lucien-Beaudin
Saint-Jean-sur-Richelieu

Le document suivant fait partie intégrante du présent permis :

- Lettre adressée au ministère du Développement durable, de l'Environnement et des Parcs, datée du 7 août 2011, signée par Hugues Lamer, concernant la demande de renouvellement du permis d'exploitation, 2 pages, 4 annexes.

Le projet devra être exploité conformément à cette demande de renouvellement de permis et à ce document.

Ce permis est valide pour cinq ans à compter de la date des présentes.

En outre, ce permis ne vous dispense pas d'obtenir toute autre autorisation requise par toute loi ou tout règlement, le cas échéant.

Pour le ministre,

Objet : Transport de matières dangereuses vers un lieu d'élimination

Mesdames,
Messieurs,

À la suite de votre demande de permis du 13 mars 2014, reçue le 24 avril 2014 et complétée le 5 mai 2014, je délivre au titulaire mentionné ci-dessus, conformément à l'article 70.11 de la *Loi sur la qualité de l'environnement* (RLRQ, chapitre Q-2), le permis à l'égard de l'activité décrite ci-dessous :

> Transport de matières dangereuses vers un lieu d'élimination.
> Les matières dangereuses visées sont celles listées à l'annexe 4 du *Règlement sur les matières dangereuses* (Q-2, r. 32).

Les lieux de remisage de ce système de transport sont situés aux emplacements ci-après :

- 98, des Équipements, Rivière-du-Loup, G5R 5W9
- 2378, de la Rotonde, Charny, G4X 3C3

Les documents suivants font partie intégrante du présent permis :

- Demande de permis pour le transport de matières dangereuses vers un lieu d'élimination, datée et signée le 13 mars 2014 par Raymond Boisvert, 6 pages et annexes.
- Renseignements supplémentaires reçus par courriel de la part de Raymond Boisvert, datés du 5 mai 2014, 1 page.

En cas de divergence entre ces documents, l'information contenue au document le plus récent prévaudra.

Le projet devra être réalisé et exploité conformément à ces documents.

Ce permis est valide pour cinq ans à compter de la date des présentes, conformément à l'article 70.14 de ladite loi.

En outre, ce permis ne dispense pas le titulaire d'obtenir toute autorisation requise par toute loi ou tout règlement, le cas échéant.

Objet : Gestion, entreposage et traitement de matières dangereuses résiduelles après en avoir pris possession

Mesdames,
Messieurs,

À la suite de votre demande de renouvellement de permis datée du 11 janvier 2013, reçue le 17 janvier 2013 et complétée le 21 février 2013, je délivre au titulaire mentionné ci-dessus, conformément à l'article 70.9 de la *Loi sur la qualité de l'environnement* (RLRQ, chapitre Q-2), le permis à l'égard des activités décrites ci-dessous :

L'entreposage, après en avoir pris possession à cette fin, de matières dangereuses résiduelles appartenant aux catégories mentionnées à l'annexe 4 du *Règlement sur les matières dangereuses* (Q-2, r. 32). La capacité maximale d'entreposage sera de 1 555 160 kilogrammes.

Les principales activités de traitement de matières dangereuses résiduelles qui seront réalisées se résument comme suit :

- traitement d'huiles usées dans le but de les revendre à des fins énergétiques;
- traitement d'eaux contaminées dangereuses;
- perforation de canettes aérosol.

Ces activités se dérouleront sur le lot 4 058 510 du cadastre du Québec, ville de Rivière-du-Loup, municipalité régionale de comté de Rivière-du-Loup.

Les documents suivants font partie intégrante du présent permis :

- Demande de renouvellement de permis datée et signée le 11 janvier 2013 par Raymond Boisvert, coordonnateur environnement, et reçue le 17 janvier 2013, 5 pages et annexes.
- Renseignements supplémentaires datés et signés le 5 février 2013 par Raymond Boisvert, coordonnateur environnement, 1 page.
- Renseignements supplémentaires datés et signés le 20 février 2013 par Raymond Boisvert, coordonnateur environnement, et reçus le 21 février 2013, 2 pages et annexes.

En cas de divergence entre ces documents, l'information contenue au document le plus récent prévaudra.

Le projet devra être réalisé et exploité conformément à ces documents.

Ce permis est valide pour une durée de cinq ans à compter de la date des présentes.

En outre, ce permis ne dispense pas le titulaire d'obtenir toute autre autorisation requise par toute loi ou tout règlement, le cas échéant.

Objet : Exploitation d'une entreprise de récupération et recyclage de métaux non ferreux et d'accumulateurs au plomb

Mesdames,
Messieurs,

À la suite de votre demande de cession datée du 21 avril 2009, reçue et complétée le 22 avril 2009, concernant le certificat d'autorisation délivré en vertu de l'article 22 de la Loi sur la qualité de l'environnement (L.R.Q., chapitre Q-2), le 11 novembre 2005 à La Compagnie Américaine de Fer et Métaux inc., j'autorise, conformément au deuxième alinéa de l'article 24 de la Loi sur la qualité de l'environnement, la cession de ce certificat d'autorisation à la compagnie Fer et Métaux Américains S.E.C.

Cette cession est délivrée à l'égard du projet décrit ci-dessous :

> Exploiter une entreprise de récupération et recyclage de métaux non ferreux en vrac et d'accumulateurs au plomb, comprenant une presse pour la mise en ballots des métaux et un système d'épuration atmosphérique qui lui est rattaché, ainsi que des aires d'entreposage et de transbordement étanches ou équipées de système de récupération des fluides, pour une capacité annuelle maximale de production de 16 500 tonnes de métaux non ferreux et de 480 tonnes d'accumulateurs au plomb, dont la quantité de

N/Doc. : 400580354

Le 29 avril 2009

matières dangereuses résiduelles entreposées, incluant lesdits accumulateurs, sera inférieure en tout temps à 40 000 kg.

Ces installations seront exploitées sur le lot 2 337 946 du cadastre rénové de la province de Québec, dans l'arrondissement Limoilou de la ville de Québec, Communauté métropolitaine de Québec.

Les documents suivants font partie intégrante de la présente cession de certificat d'autorisation :

- Lettre acheminée au ministère du Développement durable, de l'Environnement et des Parcs, signée le 21 avril 2009 par M. Mathieu Germain de Fer et Métaux Américains S.E.C., 2 pages, concernant l'engagement à respecter le certificat d'autorisation en plus des documents joints.

Le projet devra être réalisé et exploité conformément au certificat d'autorisation cédé, aux documents qui en faisaient partie, à la demande de cession et aux documents qui font partie intégrante de cette cession de certificat d'autorisation et aux conditions de cette cession.

En outre, cette cession de certificat d'autorisation ne dispense pas le titulaire d'obtenir toute autre autorisation requise par toute loi ou tout règlement le cas échéant.

Pour la ministre,

APPENDIX D.2

2016 INCINERATOR ASH TESTING RESULTS

TABLE D.2.1
BAFFINLAND IRON MINES CORPORATION
MARY RIVER PROJECT

2016 QIA AND NWB ANNUAL REPORT FOR OPERATIONS
ANNUAL INVENTORY AND STATUS OF INCINERATOR ASH PRODUCED DURING 2016

Category	Mine Site Bins	Mine Site ~Volume m^3	Mine Site Status	Milne Port Bins	Milne Port ~Volume m^3	Milne Port Status
Landfill	10 + 6 barrels	30.50	Landfilled	2 + 91 barrels	29.22	Landfilled
Hazardous	0	0.00	-	1 barrel	0.257	Stored for offsite disposal
Total	10 + 6 barrels	30.50	N/A	2 + 92 barrels	29.47	N/A

ANNUAL EXCEEDANCES OF INCINERATOR ASH PRODUCED DURING 2016

Sample ID	Sample Date	Analyte	Minimum Detection Limit	Guideline	Result	Status
MP-ASH-191	2016-09-24	Cr	0.05 mg/L	5mg/L	22.3 mg/L	Stored for offsite disposal

Note: TCLP residual analysis tests were performed by ALS Laboratories and compared to Process Residuals Discharge Minimum (GN, 2011) to determine if ash was landfill compliant. 2016 produced incinerator ash volume: Bin = 3.62 m3 * 0.8 Barrel = 85 Gal *0.8, Volumes converted to m^3.

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Quality Control Report

Workorder: L1741841 Report Date: 10-MAR-16

Client: BAFFINLAND IRON MINES CORPORATION
2275 Upper Middle Rd. E. Suite #300
Oakville ON L6H 0C3

Contact: Jim Millard

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

LEACH-TCLP-WT	Waste	Leachate Procedure for Reg 347	EPA 1311
Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).			
MET-TCLP-EXTRA-WT	Waste	O. Reg 347 Extra Metals on TCLP Leachate	EPA 200.8
MET-TCLP-WT	Waste	O.Reg 347 TCLP Leachable Metals	EPA 200.8
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1766942 were received on 12-MAY-16 10:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-TCLP-WT	Waste	Mercury (CVAA) for O.Reg 347	SW846 7470A
LEACH-TCLP-WT	Waste	Leachate Procedure for Reg 347	EPA 1311

Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).

ALS Test Code	Matrix	Test Description	Method Reference**
MET-TCLP-EXTRA-WT	Waste	O. Reg 347 Extra Metals on TCLP Leachate	EPA 200.8
MET-TCLP-WT	Waste	O.Reg 347 TCLP Leachable Metals	EPA 200.8
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-TCLP-WT	Waste	Mercury (CVAA) for O.Reg 347	SW846 7470A
LEACH-TCLP-WT	Waste	Leachate Procedure for Reg 347	EPA 1311

Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).

ALS Test Code	Matrix	Test Description	Method Reference**
MET-TCLP-EXTRA-WT	Waste	O. Reg 347 Extra Metals on TCLP Leachate	EPA 200.8
MET-TCLP-WT	Waste	O.Reg 347 TCLP Leachable Metals	EPA 200.8
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

ALS Sample # (lab use only)	Sample Identification and/or Coordinates (This description will appear on the report)	Date (dd-mmm-yy)	Time (hh:mm)	Sample Type	BIM-TCLP-MET1-WT (TCLP Hg,Ag,As,Ba,Cd,Cr,Pb,Se,Zn) -	Number of Containers
1	MS-ASH-144	28-Nov-16	14:10	Soil	R	2
2	MS-ASH-145	28-Nov-16	14:00	Soil	R	2

Drinking Water (DW) Samples[1] (client use)

Are samples taken from a Regulated DW System? ☐ Yes ☑ No

Are samples for human drinking water use? ☐ Yes ☑ No

Special Instructions / Specify Criteria to add on report (client Use)

Site Specific Criteria - Account Manager to update as required.

SAMPLE CONDITION AS RECEIVED (lab use only)

Frozen ☐ SIF Observations Yes ☐ No ☐

Ice packs Yes ☐ No ☐ Custody seal intact Yes ☐ No ☐

Cooling Initiated ☐

INITIAL COOLER TEMPERATURES °C | FINAL COOLER TEMPERATURES °C 12.2

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-TCLP-WT	Waste	Mercury (CVAA) for O.Reg 347	SW846 7470A
LEACH-TCLP-WT	Waste	Leachate Procedure for Reg 347	EPA 1311
Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).			
MET-TCLP-EXTRA-WT	Waste	O. Reg 347 Extra Metals on TCLP Leachate	EPA 200.8
MET-TCLP-WT	Waste	O.Reg 347 TCLP Leachable Metals	EPA 200.8
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend & Qualifier Definitions:

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR: Exceeded ALS recommended hold time prior to sample receipt.
EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT: Exceeded ALS recommended hold time prior to analysis.
Rec. HT: ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1776293 were received on 25-MAY-16 06:30.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-TCLP-WT	Waste	Mercury (CVAA) for O.Reg 347	SW846 7470A
LEACH-TCLP-WT	Waste	Leachate Procedure for Reg 347	EPA 1311

Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).

ALS Test Code	Matrix	Test Description	Method Reference**
MET-TCLP-EXTRA-WT	Waste	O. Reg 347 Extra Metals on TCLP Leachate	EPA 200.8
MET-TCLP-WT	Waste	O.Reg 347 TCLP Leachable Metals	EPA 200.8
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Drinking Water (DW) Samples[1] (client use)

Are samples taken from a Regulated DW System? ☐ Yes ☑ No

Are samples for human drinking water use? ☐ Yes ☑ No

Special Instructions / Specify Criteria to add on report (client Use)

Site Specific Criteria - Account Manager to update as required.

SAMPLE CONDITION AS RECEIVED (lab use only)

Frozen ☐		SIF Observations	Yes ☐ No ☐
Ice packs	Yes ☐ No ☐	Custody seal intact	Yes ☐ No ☐
Cooling Initiated ☐			

INITIAL COOLER TEMPERATURES °C	FINAL COOLER TEMPERATURES °C
15°C	20.7

SHIPMENT RELEASE (client use)		
Released by: Bill Bowden	Date: 26-May-16	Time: 14:00

INITIAL SHIPMENT RECEPTION (lab use only)		
Received by: Matt Evans	Date: May 26, 16	Time: 2:30

FINAL SHIPMENT RECEPTION (lab use only)		
Received by: MM	Date: 3 Jun 16	Time: @ 9:45

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Chromium (Cr)	MS-B	L1815462-1, -2, -3, -4, -5, -6

Sample Parameter Qualifier key listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-TCLP-WT	Waste	Mercury (CVAA) for O.Reg 347	SW846 7470A
LEACH-TCLP-WT	Waste	Leachate Procedure for Reg 347	EPA 1311

Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).

ALS Test Code	Matrix	Test Description	Method Reference**
MET-TCLP-EXTRA-WT	Waste	O. Reg 347 Extra Metals on TCLP Leachate	EPA 200.8
MET-TCLP-WT	Waste	O.Reg 347 TCLP Leachable Metals	EPA 200.8
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
LTIS	Limited sample was available for TCLP inorganics and semi-volatiles extraction (< 100 grams). Extraction fluid volume and/or other elements of the TCLP method were scaled down proportionately to permit analysis. Test results from modified TCLP procedures may be unsuitable for regulatory purposes.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-TCLP-WT	Waste	Mercury (CVAA) for O.Reg 347	SW846 7470A
LEACH-TCLP-WT	Waste	Leachate Procedure for Reg 347	EPA 1311

Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).

ALS Test Code	Matrix	Test Description	Method Reference**
MET-TCLP-EXTRA-WT	Waste	O. Reg 347 Extra Metals on TCLP Leachate	EPA 200.8
MET-TCLP-WT	Waste	O.Reg 347 TCLP Leachable Metals	EPA 200.8
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Chromium (Cr)	MS-B	L1845978-1

Sample Parameter Qualifier key listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-TCLP-WT	Waste	Mercury (CVAA) for O.Reg 347	SW846 7470A
LEACH-TCLP-WT	Waste	Leachate Procedure for Reg 347	EPA 1311

Inorganic and Semi-Volatile Organic contaminants are leached from waste samples in strict accordance with US EPA Method 1311, "Toxicity Characteristic Leaching Procedure" (TCLP). Test results are reported in leachate concentration units (normally mg/L).

ALS Test Code	Matrix	Test Description	Method Reference**
MET-TCLP-EXTRA-WT	Waste	O. Reg 347 Extra Metals on TCLP Leachate	EPA 200.8
MET-TCLP-WT	Waste	O.Reg 347 TCLP Leachable Metals	EPA 200.8
MOISTURE-WT	Soil	% Moisture	Gravimetric: Oven Dried

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid weight of sample

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

STREAMFLOW DATA FOR TYPE A WATER LICENCE MONITORING LOCATIONS

STORY environmental inc

MEMO

To:	Andrew Vermeer Regulatory Reporting Specialist Baffinland Iron Mines	**From:**	Andrew Rees, Ph.D., EP Senior Environmental Scientist
Re:	2016 Hydrometric Monitoring Program at Water License Sites	**Date:**	20 March 2017
		Proj No:	199-03-09

1 Introduction

A monitoring requirement of the Type A Water Licence #2AM-MRY1325 issued to Baffinland Iron Mines Corporation (Baffinland) for the Mary River Project is to measure the flow and the water quality of surface discharge at locations established as part of the Surveillance Network Program (SNP). Hydrometric monitoring at or near nine of the SNP stations was initiated in 2014. The SNP Station names, types, and data collected are summarized in Table 1.1.

Table 1.1 SNP Hydrometric Stations

SNP Station	Hydrometric Station Type	Data Collected
MQ-C-B MQ-C-D MS-C-A/B	Hydrometric station installed using natural channel control	Discharge and water level were measured during weekly sampling events to validate stage-discharge relationships. Water level data loggers were downloaded monthly.
MP-Q1-01 MP-Q1-02 MP-C-B MS-MRY-13a MQ-C-A MS-C-E	Hydrometric station installed using thin plate V-notch weir flow measurement structures	Water level measured weekly. Water level data loggers downloaded monthly.

2 Measurement of Discharge

Site visits were made to the SNP hydrometric stations in June, July, and August 2016. An initial site visit was conducted in June 2016 to re-install the water level data loggers, measure flow, and perform maintenance where required. The weir boxes were removed and re-installed at MP-Q1-01 and MP-Q1-02 to address the accumulation of sediment and leakage. Additional site visits were made in July and August to measure flow.

3 Daily Discharge Data

Water level data were recorded at each site on 15 minute intervals and daily discharge was calculated by averaging the 15 minute data on a daily basis.

The daily discharge data recorded at all SNP Stations for June and July are shown in Table 3.1 and for August and September in Table 3.2.

MOVEMENT DOCUMENT / MANIFEST
DOCUMENT DE MOUVEMENT / MANIFESTE

This Movement document/manifest conforms to all federal and provincial transport and environmental legislation.
Ce document de mouvement/manifeste est conforme aux législations fédérale et provinciale sur l'environnement et le transport.

HL61035-2

Movement Document / Manifest Reference No. / N° de référence du document de mouvement/manifeste

A Generator / consignor — Producteur / expéditeur

Registration No. / Provincial ID No. / N° d'immatriculation - d'id. provincial: NUG100023

Company name / Nom de l'entreprise: BAFFINLAND IRON MINES CORPORATION

Mailing address / Adresse postale, City / Ville, Province, Postal code / Code postal: 2275, UPPER MIDDLE, OAKVILLE, ON,

E-mail / Courrier électronique: bdion@genv.ca — Tel. No. / N° de tél.: 514 940 3332

Shipping site address / Adresse du lieu de l'expédition: STEENSBY CAMP SITE

City / Ville: STEENSBY — Province: NUNAVUT — Postal code / Code postal:

Intended Receiver / consignee — Réceptionnaire / destinataire prévu: QIKIQTAALUK ENVIRONMENTAL — Registration No. / Provincial ID No. / N° d'immatriculation - d'id. provincial:

Mailing address / Adresse postale, City / Ville, Province, Postal code / Code postal: 9435 CHATEAUNEUF ST, SUITE 200, BROSSARD QC

E-mail / Courrier électronique: — Tel. No. / N° de tél.: 514 940 3332

Receiving site address / Adresse du lieu de l'expédition: 950, BOUL. GERARD-CADIEUX

City / Ville: VALLEYFIELD — Province: QC — Postal code / Code postal: J6T 6L4

B Carrier — Transporteur

Registration No. / Provincial ID No. / N° d'immatriculation - d'id. provincial:

Company name / Nom de l'entreprise: NUNAVUT SEALINK SUPPLY INC.

Mailing address / Adresse postale, City / Ville, Province, Postal code / Code postal: 201-6565 HEBERT BL, STE-CATHERINE, QC, J5C 1B5

E-mail / Courrier électronique: — Tel. No. / N° de tél.: 450 635 0833

Vehicle / Véhicule	Registration No. / N° d'immatriculation	Prov.
Trailer - Rail car No. 1 / 1re remorque - wagon	N/V ROSAIRE DESGAGNÉS	
Trailer - Rail car No. 2 / 2e remorque - wagon		

Port of entry / Point d'entrée: International use only — Port of exit / Point de sortie: International use only

Carrier Certification: I certify that I have received waste or recyclable material from the generator / consignor for delivery to the receiver / consignee as set out in Part A and that the information contained in Part B is complete and correct. Attestation du transporteur : J'atteste avoir reçu les déchets ou matières recyclables du producteur / expéditeur en vue de leur livraison au réceptionnaire / destinataire, tels qu'ils figurent à la partie A et que les renseignements inscrits à la partie B sont exacts et complets.

Name of authorized person (print) / Nom de l'agent autorisé (caractères d'imprimerie): Jordan Ruest — Tel. No. / N° de tél.: 450 635 0833

Year / Année: 16 — Month / Mois: 08 — Day / Jour: 29 — Signature: [signature]

C Receiver / consignee — Réceptionnaire / destinataire

Reference Nos. of other movement document(s)/manifest(s) used / N° de référence des autres documents de mouvement/manifestes: BLM QE16-149-2

Registration No. / Provincial ID No. / N° d'immatriculation - d'id. provincial:

Receiver / consignee information same as in Part A / Les renseignements du réceptionnaire / destinataire est la même qu'à la Partie A

SHIPPER'S DECLARATION **I hereby declare that the contents of this consignment are fully and accurately described above by the Proper Shipping Name, and are classified, packaged, marked and labelled/placarded, and are in all respects in proper condition for transport according to applicable international and national government regulations.**	Name/status of declarant: YVON BEAUDOIN / QE project manager Place and date: STEENSBY INLET, NU, 08/29/2016 Signature on behalf of shipper: [signature]

APPENDIX D.5

WASTE ROCK GEOCHEMISTRY REPORT, DATA AND STATUS UPDATE

Geochemical Characterization Program - Implementation Schedule Update - March 2017

		Refer to Report Section	Description	Status
1.0	**DRILLING PROGRAM**			
1.01	**Execute Drilling Program**	3.2.2, 3.3	2,000 - 3,000 m drill program utilizing rotary core rig focused on footwall and hanging wall of the deposit.	Program completed in Q3 2012.
1.02	**Core Logging**	3.3	Log and sample core in accordance to established methods.	Program completed in Q3 2012.
1.03	**Field Scale Geological Interpretation**	3.3	Utilizing new information obtained from drill logs, revise geological maps and cross-sections of the footwall and hanging wall of the deposit.	Rresults reported in 2013 and 2014 updates to the Waste Rock Management Plan.
2.0	**PREDICTIVE GEOCHEMICAL SAMPLING AND TESTING PROGRAMS**			
2.01	**Sampling**	4.1, 4.5	Systematic sampling of 2012 drill core of footwall and hanging wall based on established methods.	Program completed in Q3 2012.
2.02	**Static Testing**	4.2, 4.5	Static testing of select 2012 drill cores using established analytical methodologies.	Program completed in Q4 2012.
2.03	**Mineralogy**	4.3, 4.5	Detailed mineralogical characterization by R-XRD, optical microscopy, and SEM.	First phase of program completed in Q1 2013. Work still ongoing.
2.04	**PAG Segregation**	4.5	Ongoing synthesis of available data to assess importance and ability to segregate PAG materials.	Ongoing.
2.05	**Kinetic Testing - ongoing work**	4.4	Continuation of kinetic test initiated in May 2011.	Select humidity cells continue to run to present time.
2.06	**Kinetic Testing - from 2012 drill core**	4.4, 4.5	Continued expansion of laboratory kinetic test work program,	Further Expansion not required
			Upgrade and ongoing sampling of lysimeters, monitoring wells, and seepage.	Program currently not active. Work to recommence once there is adequate development of waste rock storage area.
			Assess feasibility of field waste rock test piles.	Ongoing.
			If feasible, construct and sample test piles.	To be determined.
3.0	**WATER QUALITY PREDICTIONS - WASTE ROCK AND PIT**			
3.01	**Hydrology**	5.4	Collect additional hydrological data.	Hydrology station established near waste rock storage area to collect site specific data for the purpose of future water quality modeling.
3.02	**Source Terms**	5.4	Better quantify source terms for pit and waste rock models.	Ongoing.
3.03	**Proportion of PAG**	5.4	Better quantify proportion of PAG in waste rock pile and pit walls.	Ongoins.
3.04	**ARD On-Set Time**	5.4	Improve understanding of ARD on-set times.	Ongoing.
3.05	**Surface Areas and Permafrost**	5.4	Improve understanding of surface area scaling values, active zone thickness, and water infiltration into waste rock pile. Conduct thermal modeling of waste rock pile.	Work to commence once there is adequate development of waste rock storage area.
3.06	**Mineralogy**	5.4	Incorporate processes of metal sorption and solid phase precipitation behaviour.	Ongoing.
4.0	**REPORTING UPDATES**			
4.01	**Interim Waste Rock Geochemical Characterization Report**	7.2	Annual report updates that present latest results of geochemical characterization program including waste rock geochemistry, waste rock and pit water quality modeling , and related studies. Reports to be provided March 31 of each year.	Technical updates provided in QIA/NWB Annual Reports.
4.02	**Waste Rock Water Quality Modeling Report**	7.2		Planned for 2017 once there is sufficient data available.
4.03	**Open Pit Water Quality Modeling Report**	7.2		Planned for 2017 once there is sufficient data available.

2017 Review of Mine Rock Humidity Cell Program

1.0 INTRODUCTION

Amec Foster Wheeler Environment & Infrastructure, a division of Amec Foster Wheeler Americas Limited (Amec Foster Wheeler, formerly AMEC) has been retained by Baffinland Iron Mines Corporation (Baffinland) to conduct ML/ARD characterization of mine rock for Deposit 1 of the Mary River Project. On-going studies in support of this project include humidity cell testing of selected mine rock samples. The objective of this technical memorandum is to provide an updated review of mine rock humidity cell results that have been received since the last humidity cell update was issued on 24 March 2016, titled *Mary River Project 2016 Review of Mine Rock Humidity Cell Program* (Amec Foster Wheeler 2016).

2.0 HUMIDITY CELL OVERVIEW

The mine rock humidity cell testing program includes eleven standard humidity cells and eight carbonate depleted cells (nineteen cells in total). Eight of the nineteen humidity cells have been terminated, as recommended by AMEC in June 2014. At that time, AMEC also recommended the initiation of two new standard humidity cells (16628 and 16634) to represent previously untested mineralized waste materials expected to be present in mine rock stockpiles in generally low tonnages. The operational status of all nineteen mine rock humidity cells is provided in Table 1. Previous documentation and analysis of mine rock humidity cell data is provided in the document *Mine Rock ML/ARD Geochemical Characterization Report – Deposit 1, Mary River Project* (AMEC 2014).

A representative set of samples were selected for humidity cell analysis based on a static testing program that was conducted in 2010. The samples for humidity cell testing were selected primarily to assist with refining the threshold between potentially acid generating (PAG) and non-PAG materials, and to better understand the effectiveness of non-carbonate neutralization potential (NP) in limiting low pH drainage. The selected samples are well distributed spatially across the deposit and include a range of metal contents. The representativeness of the humidity cells in relation to acid potential (AP), NP, and metal contents are provided graphically in Appendix A.

2.1 Standard Humidity Cells

The purpose of testing using standard humidity cells (herein referred to as ‘humidity cells’) was to assess the lag time to net acidic conditions of PAG samples with different ranges of AP and NP contents. A second objective was to more carefully assess the threshold between PAG and non-PAG materials, which have been defined only on the basis of static testing (e.g. acid base accounting) and assuming all materials with an NPR (neutralization potential ratio, or NP/AP) less than two are PAG. Humidity cell testing of materials with NPR values between 1 and 2 may provide better information on what the appropriate NPR threshold to segregate acid generating from non-acid generating rock will be and how effective categorization of PAG and non-PAG based on NP is for these materials with generally low rates of sulphide oxidation rate and low NP.

A humidity cell program was previously conducted for 53 weeks on ten rock samples from the Mary River project in early 2008 (Knight Piésold, 2008). Five of the samples each represented a single lithology, while the others were of mixed lithology or consisted of composites of two or more lithologies. In addition, one of the samples had a sulphide content of 5% which is considered high for mine rock at the project site.

The current standard humidity cell testing program was initiated by Amec Foster Wheeler in May 2011. Selection of samples was primarily focused on the three main lithologies (gneiss, schist and volcanic tuff) and covered a range of sulphide and metals content. An upper sulphide content limit of around 1% was considered to be representative of most of the PAG rocks based on available ABA data. Representative rock samples with NPR <2 were selected from the major hanging wall and footwall lithologies. Several non-PAG samples (NPR >2) were also included to provide information on the broader range of rock compositions expected in the future mine rock stockpile.

Static test results for the humidity cell samples are presented in Table 2. Nine rock samples representing major lithologies of hanging wall and footwall rock were selected for humidity cell testing based on the waste subdivisions available at the time. Samples have since been categorized according to updated waste type subdivisions (FW, FWS, HW, HWS, IW – see AMEC 2014). A single sample of magnetite dominant ore was also included in the program.

2.2 Depleted Neutralization Potential Humidity Cells

The results of ABA testing on the Mary River Deposit No.1 samples indicated that the carbonate NP of the samples was generally low compared to the modified Sobek NP. A large portion of samples (approximately 76%) had carbonate NP that was 20% or less than the Sobek NP. These results suggest that silicate minerals are the long-term source of NP after the carbonate minerals are exhausted. Silicate minerals are reportedly able to buffer mine waste pH at near neutral conditions under low acid generation rates (Mattson, 2009; Miller et al., 2010). However, the effectiveness of silicate NP is dependent on the material and particularly the specific minerals present, and sulphide reaction rates.

To test the effectiveness of silicate NP, specialized carbonate NP-depleted humidity cells were initiated in September 2011. These cells are being operated to assess the drainage chemistry of mine rock devoid of carbonate neutralization capacity. Samples were subjected to a sodium acetate leach prior to placement in the cells to dissolve and remove carbonate minerals prior to testing.

Eight samples from the major lithologies (gneiss, schist and volcanic tuff) were selected for NP-depleted humidity cell testing (Table 2).

2.3 Mineralized Waste Humidity Cells

In 2014, Amec Foster Wheeler initiated two additional humidity cells representing mineralized waste: one typical banded iron formation mine rock sample and one typical high grade iron formation mine rock sample. These were initiated to better assess the possible future impact of these previously untested, low tonnage materials that are expected to make up less than 1% of the mine rock.

3.0 RESULTS AND ANALYSIS

A summary of ABA and key metal characteristics (copper, nickel and zinc) for each cell are provided in Table 2. Summary static data for the cells and statistical distribution of the cells in comparison to the range of ABA and selected metals data are provided in Appendix A. Humidity cell data plots for the nineteen cells are presented in Appendix B, and are grouped as Hangingwall, Footwall, and Mineralized Waste.

Overall, the humidity cell results continue to exhibit a protracted period of generally circum-neutral pH (with a few exceptions) over the duration of testing (now at over 5.5 years of operation) indicating that PAG mine rock is expected to exhibit an extended lag time to acid on-set, perhaps on the order of a decade or longer under field conditions, even in the absence of neutralization capacity from carbonates.

3.1 Hanging wall and Footwall Humidity Cells

Based on over five years of data for NP depleted humidity cells, the following observations are made regarding the hanging wall and footwall humidity cells:

- The pH of most cells exhibited a gradual declining trend over test duration with the following exceptions:
    - Hanging wall schist sample (MRARD10-092) reported generally steady pH between 6 and 7 for the duration of the test;
    - NP-depleted footwall gneiss samples MRARD10-057 and MRARD10-123 reported a generally steady pH between 6 and 7 prior to termination in week 154 after approximately 3 years of testing; and
- Throughout testing, the pH of most of the cells showed a slightly declining trend but maintained pH values generally between 5.5 to 7 with the following exceptions:

- A low sulphide (0.06% sulphide) NP depleted cell containing hanging wall volcanic tuff (MRARD10-82) exhibited pH values that have fluctuated between 4.5 and 6 over the duration of testing. After week 200, pH values fluctuated between 4.6 and 5.5;

- Two footwall cells (MRARD10-055 and MRARD10-074) exhibited gradually declining pH throughout testing, reaching pH values below 5 after between 2 and 3 years of operation; and,

- One footwall cell (5178) exhibited gradually declining pH throughout testing, reaching the lowest observed pH, slightly above 4, within the first three years of operation and has remained generally steady in this range over the subsequent 2.5 years. This cell contained the second highest sulphide content (0.9%) of all of the humidity cells.

- Sulphate release rates for most cells generally declined in the first 20 weeks of operation and subsequently exhibited a stable trend or continued to steadily decline at a slow rate with these exceptions:

  - NP Depleted hanging wall schist sample MRARD10-026, which showed fluctuating sulphate release rates between 2 mg/kg/wk and 30 mg/kg/wk over the last 2.5 years; and

  - Footwall schist sample 5178 which showed slightly increasing sulphate release rates between 20 mg/kg/wk and 50 mg/kgwk over approximately the last three years.

- Sulphate release rate weakly correlates to sulphide content;

  - The two highest average sulphate release rates of 23 mg/kg/wk and 29 mg/kg/wk were reported by humidity cell samples 5178 and MRARD10-074, which also reported the highest solid phase sulphide concentrations of 0.9% and 1%.

  - The two lowest average sulphate release rates of 0.70 mg/kg/wk and 0.67 mg/kg/wk were reported by humidity cell samples 5172 and 5174, which also reported the lowest solid phase sulphide concentrations of 0.015% and 0.011%.

  - Humidity cells with solid phase sulphide concentrations between 0.05% 0.3% reported average sulphate release rates between 2 mg/kg/wk and 9 mg/kg/wk that generally correlated to sulphide content.

- Two footwall cells (MRARD10-055, MRARD10-123) exhibited a gradual increasing trend in sulphate release after the first 20 weeks of operation becoming generally steady after 50 to 100 weeks of operation. Cell MRARD10-123 was terminated after 154 weeks of testing.

- The highest steady sulphate release rates were observed for footwall samples 5178 and MRARD10-074, and ranged between 10 mg/kg/wk and 40 mg/kg/wk. These cells had the highest footwall sulphide content of 0.9% and 0.6% respectively. Hangingwall samples with similar sulphide content reported lower sulphate release rates prior to termination (MRARD10-080 reported 10 mg/kg/wk sulphate; MRARD10-105 reported 3 mg/kg/wk sulphate).

- One hangingwall cell (MRARD10-051) at approximately 150 weeks of operation exhibited a spurious spike in sulphate and associated metals release (especially iron) prior to termination. This is inferred to represent sudden dissolution of a minute sulphide grain (e.g. 0.5 mg as pyrite) in this cell at that time.

- NP depleted hanging wall cell MRARD10-026 reported fluctuating but generally increasing sulphate release rates generally near 10 mg/kg/wk in the last year of testing. This cell reported a solid phase sulphide concentration of 0.2%.

- The carbonate molar ratio or CMR [(Ca+Mg)/SO_4] for most cells is in the range of 0.5 to 1.5 with a few cells that had CMRs as low as 0.1, and two cells with CMRs near two. CMRs in the range of 1 to 2 are expected for cells where acidity generated by sulphide oxidation is neutralized by carbonate dissolution. However, the Baffinland humidity cell samples are known to be very low in carbonate, or are carbonate depleted. The majority of cells also show the release of magnesium at higher rates than calcium on a molar basis, suggesting that dissolution of non-carbonate minerals is occurring; perhaps biotite and/or chlorite.

- Based on depletion calculations, only three cells (5171, MRARD10-105 and MRARD10-120) are inferred to still contain carbonate minerals after their respective testing periods. Only cell 5171 continues to operate. Cells MRARD10-105 and MRARD10-120 were terminated after approximately three years of testing.

- Footwall cell 5171 with low but relatively elevated carbonate NP in comparison to other test materials (2.8 kg $CaCO_3$/t) notably exhibited initially high CMRs that reached a CMR of 5 after the first 20 weeks of operation and then gradually declined to approximately 2 after 140 weeks. This suggests that sulphide oxidation was low enough before 140 weeks that a significant component of the carbonate NP was being depleted by the weakly acidic deionized water flush alone.

- For all cells except those with leachate pH values below five, 12 elements (Ag, Al, As, Be, Bi, Cr, Li, Pb, Sb, Tl, W and Zn) had leachate concentrations that were generally at or near detection.

- Metal release rates are generally the highest in the lower pH humidity cells with notable release rates for Cd, Co, Cu, Ni, Pb and Zn in cells MRARD10-055 and 5178 which also contain near worst case solid concentrations for these metals in Deposit 1 mine rock.

- The noted elevated metal release rates for cells MRARD10-055 and 5178 exhibited increasing metal release trends over the first 50 to 100 weeks of operation and have since exhibited steady or declining trends.

3.2 Mineralized Waste Humidity Cells

Based on 125 weeks of data for the mineralized waste humidity cells, the following observations are provided:

- The pH of the banded iron formation humidity cell was acidic and ranged between pH 4.2 and pH 4.9 over the test period.

- The pH of the high grade iron formation mine rock cell was generally steady and circum-neutral between pH 6 and pH 7 over the test period.

- Sulphate release rates gradually decreased throughout testing to values below 7 mg/kg/wk for the high grade iron formation cell and below 10 mg/kg/wk for the internal waste banded iron formation cell after week 120.

- Metal release rates generally decreased to approximately steady release rates after week 50 for both samples, with generally higher metal release rates observed for the lower pH banded iron formation cell as expected.

- Some metals may be showing increasing release rates in the High Grade Iron Formation sample after approximately week 100 (Ag, Ba, Co, Cu, Si).

RE: *FISHERIES ACT* DIRECTION

This document constitutes a direction to the persons named above, pursuant to subsection 38(7.1) of the *Fisheries Act* as amended, hereinafter referred to as the *Fisheries Act*.

This direction confirms in writing the verbal direction given to Baffinland Iron Mines Corporation (BIM), c/o **Mr. James Millard, Mr. Sylvain Proulx**, and **Mr. Bernard Laflamme**, on **May 20, 2016.**

In addition, the following recipients of this written direction was not provided with a verbal direction, but have been added to this written direction:

Brian Penney
Chief Executive Officer

Todd Burlingame
Vice-President, Sustainable Development

REASONABLE GROUNDS FOR BELIEF

I, Curtis Didham, an Inspector designated by the Minister of Fisheries and Oceans under subsection 38(1) of the *Fisheries Act*, have reasonable grounds to believe:

1. That there occurs a deposit of a deleterious substance in water frequented by fish that is not authorized under the *Fisheries Act* and there is a serious and imminent danger of a deposit of a deleterious substance in water frequented by fish.

2. That detriment to fish habitat or fish or to the use by humans of fish results or may reasonably be expected to result from the occurrence and that immediate action is necessary in order to take all reasonable measures consistent with the public safety and with the conservation and protection of fish and fish habitat to prevent the occurrence or to counteract, mitigate or remedy any adverse effects that result from the occurrence or might reasonably be expected to result from it.

3. That all reasonable measures consistent with public safety and with the conservation and protection of fish and fish habitat have not been taken as required by subsection 38(6) of the *Fisheries Act*.

4. That I observed that and/or was informed that:

    a. The BIM, Mary River Project is a high-grade iron ore mine operation located in the Qikiqtani Region of northern Baffin Island, Nunavut.

    b. The Mary River Project is owned and operated by BIM.

    c. To allow use of water and to deposit waste to water activity the BIM, Mary River Project was issued a Nunavut Water Board Water type A Licence 2AM-MRY1325 pursuant to the *Nunavut Waters and Nunavut Surface Rights Tribunal Act* in which Indigenous and Northern Affairs Canada (INAC) enforces.

    d. The BIM, Mary River Project was issued a No. 005 Project Certificate (NIRB File No 08MN053) by the Nunavut Impact Review Board pursuant to the *Nunavut Land Claims Agreement*.

e. On May 10, 2016 EO DIDHAM received an email from James Millard stating that on Saturday evening, May 7, 2016, a snowmelt event occurred at the Mary River Mine Site which caused runoff containing some discoloured water / sediment to flow to Sheardown Lake.

f. On May 10, 2016 EO DIDHAM received a NT/NU Spill Report 2016-158 from Enforcement Officer (EO) MURISON (Northern District Spills Duty Officer) which was submitted by Allan Knight (Baffinland Environmental Superintendent) stating that on Saturday evening, May 7, 2016, a snowmelt event occurred at the Mary River Mine Site which caused runoff containing some discoloured water / sediment to flow to Sheardown Lake.

g. On May 11, 2016 a teleconference meeting was held between ECCC, INAC, and BIM to discuss the NT/NU Spill Report 2016-158. During this meeting BIM committed to providing sampling results from chemistry and bioassay samples collected on May 10, 2016

h. On May 17, 2016 EO DIDHAM receives Preliminary Lab chemistry sampling results analysis from Allan Knight of Sheardown Lake Surface Water Runoff samples (pH, TSS, TDS Turbidity) TSS level readings of 54.8, 26.5, 21.5, 18.8,47.6,32.8,70,61.2,118,101,90.5,18.8,21.6,12,69.6,29.6,82 ect..... On May 27, 2016 Anne Wilson (Environment Canada Water Pollution Specialist) reviewed the preliminary Lab Analysis results and stated to EO DIDHAM in an email that "the measured TSS and turbidity are well above CCME guidelines for increases in total suspended solids and turbidity, but would not be in the acute effects range. We would expect to see issues with sediment coating the substrate, and impaired primary and secondary productivity, as well as sublethal effects on fish. It was evident from the variation in TSS-turbidity levels between sites that there are different sizes of particles for the different sampling sites, and accordingly we would expect different settling behaviors and effects on gills."

i. On May 17, 2016 EO DIDHAM received a NT/NU Spill Report 2016-176 from EO MACDONALD (Northern District spills Duty Officer) which was submitted by Allan Knight (BIM Environmental Superintendent) stating that on Tuesday, May 17, 2016 runoff containing sediments was observed to be flowing into Camp Lake Tributary # 1 and into Camp Lake.

5. On May 18 & 19, 2016 EO DIDHAM conducted a joint on-site inspection with Indigenous and Northern Affairs Canada (INAC) Water Resource Officers Justin Hack and Jonathan Mesher and INAC Environmental Assessment Jason Patchell at the BIM, Mary River Project and observed:

   a. The shoreline and above the high tide mark North West of the Milne Port iron ore stockpile and West of the Milne Port Stockpile West Sedimentation Pond (MP-06) at the Milne Port Inlet site observed snow with dust sedimentation 30 – 50 meters away from Milne Inlet, Arctic Ocean.

   b. The Milne Port Stockpile East Sedimentation Pond (MP05) located North East of the Iron Ore stockpiles was not fully constructed which was designed and being constructed to allow contact water from the iron ore stockpiles to divert into the Milne Port Stockpile East Sedimentation Pond (MP05) to prevent the contact water with the iron ore stockpiles from entering Milne Inlet, Arctic Ocean.

   c. The Milne Port Stockpile West Sedimentation Pond (MP06) located North West of the iron ore stockpiles had some ditching to allow contact water from the iron ore stockpiles to divert into the Milne Port Stockpile West Sedimentation Pond (MP06) to prevent the contact water from entering Milne Inlet, Arctic Ocean.

   d. Red rusty coloured water was observed in many culverts and bridges along the Tote Road from the Milne Port Site to the Mary River Mine Site flowing into David Lake, Mural Lake, Kabikok Lake, KM 32 Lake, KM 27 Lake, Camp Lake, Sheardown Lake, Mary River, and Phillips Creek.

e. In some areas of the Mary River Project, silt screens, silt fencing, flocculent blocks and flocculent netting in streams and culvert ditches and also check dams in streams had been installed.

f. One water pump pumping red rusty coloured water from a tributary flowing into Sheardown Lake into a constructed Mary Rive Mine Site Iron Ore Stockpile crusher sediment pond (MS06) adjacent to the iron ore stockpiles.

g. Along the Tote Road from Mary River Mine Site to the Milne Inlet Port Site there was no or very little installed 6 inch rip rap rock in the ditching to divert water from coming into contact with the Tote Road to prevent road washout and erosion.

h. Along the Tote Road from Mary River Mine Site to the Milne Inlet Port Site under all 4 bridge crossings was displaced road sediment from vehicle traffic on the surface of the ice.

i. Along the Mary River Mine Hall Tote Road leading from Mary River Camp to Deposit # 1 for 4 kilometres there was recently installed 6 inch rip rap rock in the ditching and newly installed culverts to divert water from coming into contact with the Mine Hall Tote Road preventing road washout and erosion.

6. During a face to face meeting between INAC, ECCC, and BIM held on May 19, 2016 EO DIDHAM was informed that BIM will be taking immediate actions to remove the snow impacted by dust sediment located along the shoreline and above the high tide mark North West of the Iron Ore stockpile and West of the Milne Port Stockpile West Sedimentation Pond (MP-06) at the Milne Port Site.

7. On May 19, 2016 a face to face meeting between INAC, ECCC, and BIM was held. The following was discussed:

   a. The main source of sediment runoff from the Tote Road and Mary River Mine Hall Tote Road is caused by snow that has become imbedded in the road over the winter from vehicle traffic and grading operations. In the spring as the road warms the snow imbedded in the road melts causing the water to carry the sediment off the road into culverts, ditches, and streams which leads to David Lake, Murial Lake, Kabiktok Lake, KM 32 Lake, KM 27 Lake, Camp Lake, Sheardown Lake, Mary River, and Phillips Creek.

   b. The main source of sediment surface water runoff from the tundra is caused by crushing operations, wind coming in contact with the crushed rock/iron ore stockpiles, and vehicle traffic on the Tote Road and Mary River Mine Hall Road. When the snow melts on the tundra or it rains on the tundra the water carries the settled accumulated dust sediment into David Lake, Murial Lake, Kabiktok Lake, KM 32 Lake, KM 27 Lake, Camp Lake, Sheardown Lake, Mary River, and Phillips Creek.

   c. The main source of road sediment located on top of the ice creeks/streams under all bridge crossings along the Tote Road from Milne Port to the Mary River Mine Site is caused by vehicle traffic going over the bridge by displacing the road sediment off the bridge to the surface of the ice.

8. On May 19, 2016 EO DIDHAM and INAC Water Resource Officers Justin Hack and Jonathan Mesher and Jason Patchell (INAC Environmental Assessment), and Baffinland's Connor Devereaux conducted sampling at 3 locations. Location one - Landfill Trib, Location two - Camp Lake Water Intake area near Sheardown Lake, and location 3 - Sheardown Lake Trib. Chemistry

samples (TSS, Total Metals, pH, and Radium) and two 20 litre pail samples were collected for a multi-concentration Bioassay analysis at all 3 locations.

9. On May 20, 2016 at 07:46hrs EO DIDHAM issued a verbal *Fisheries Act* Direction (FAD) to BIM, Mary River Project. In attendance were EO DIDHAM, Justin Hack, Jonathan Mesher, Jason Patchell, James Millard (Environmental Manager), Sylvain Proulx (Incoming Chief Operations Officer), and Bernard Laflamme (Outgoing Chief Operations Officer).

10. On May 21, 2016 EO DIDHAM (Northern District Spills Duty Officer) received a NT/NU Spill Report 2016-181 which was submitted by James Millard (BIM Environmental Manager) stating that on May 20, 2016 surface water runoff containing sediment was observed to be flowing from the surface of the Mine Haul Road through several breaks (punch outs) on the outer edge of the road and there was a risk to Mary River and Sheardown tributary and lake.

11. On May 21, 2016 EO DIDHAM shipped chemistry samples and multi-concentration Bioassay samples to the ECCC Lab in Edmonton from Iqaluit for analysis.

12. On May 24, 2016 EO DIDHAM receives Milne Port stockpile action plan from James Millard.

13. On May 27, 2016 EO DIDHAM receives an email from Georgina Williston (Fisheries & Oceans Canada, Senior Fisheries Protection Biologist) stating that David Lake, Murial Lake, Kabiktok Lake, KM 32 Lake, KM 27 Lake, Camp Lake, Sheardown Lake, Mary River, and Phillips Creek are all fish bearing waters or connected to fish bearing waters and most of the larger and medium sized streams with culverts and bridges belonging to those aforementioned waterbodies are also fish bearing waters and provide seasonal fish habitat, since the juvenile char and in some cases stickleback use this habitat in the open water season for feeding and rearing habitat. This confirmed the information that EO DIDHAM was aware of prior to issuing the verbal Inspectors direction.

14. On May 31, 2016 ECCC issues BIM Notice of Intent (NOI) and draft FAD c/o **Mr. James Millard, Mr. Sylvain Proulx**, and **Mr. Bernard Laflamme.**

15. On May 31, 2016 EO DIDHAM receives an email response letter regarding the issued NOI and draft FAD from Todd Burlingame (BIM, Vice-President, Sustainable Development).

16. On May 31, 2016 EO DIDHAM receives an email from James Millard stating that on May 29, 2016 a deposit of sediments was observed near Camp Lake Tributary #1. The source of the sediment was from a stream bank failure along a limited area. It is suspected that the embankment failure may have been caused by water draining from the airstrip. The event resulted in sand deposit that partially encroached on the stream.

17. On June 1, 2016 EO DIDHAM receives spill Report 2016-198 from EO MONTEITH (spills Line Duty Officer (May 31 to June 7, 2016). The spill report states that on May 29, 2016 a deposit of sediments was observed near Camp Lake Tributary #1. The source of the sediment was from a stream bank failure along a limited area. It is suspected that the embankment failure may have been caused by water draining from the airstrip. The event resulted in sand deposit that partially encroached on the stream.

18. On June 1, 2016 EO DIDHAM receives Preliminary multi-concentration Bioassay sampling results from the ECCC Prairie and Northern lab for all 3 sampling locations. All sampling location results for the multi-concentration Bioassay analysis was determined to be **not acutely lethal.**

19. On June 2, 2016 EO DIDHAM receives email from James Millard stating that during an environmental inspection of the Milne Tote Road on May 31, three locations were observed where there was turbid water and sediment present in culvert outlet locations. These locations were

stream crossings CV-223 at km 97, BG-17 at km 90, and BG-29 at km 85. The source of the sediment is erosion from spring freshet.

20. On June 2, 2016 EO DIDHAM receives spill Report 2016-202 from EO MONTEITH (spills Line Duty Officer (May 31 to June 7, 2016). The spill report states that during an environmental inspection of the Milne Tote Road on May 31, three locations were observed where there was turbid water and sediment present in culvert outlet locations. These locations were stream crossings CV-223 at km 97, BG-17 at km 90, and BG-29 at km 85. The source of the sediment is erosion from spring freshet.

21. On June 3, 2016 a teleconference oral representations meeting was held between ECCC and BIM to discuss and review the draft FAD. The purpose of this oral representations meeting was to give BIM an opportunity to be heard to clear up any factual errors in the draft FAD. During this meeting ECCC was informed that:

    a. On May 23, 2016 BIM commenced clean-up of the dust sediment impacted snow located at Milne Inlet Port shoreline and above the high tide mark North West of the iron ore stockpiles and West of the West Iron Ore Stockpile Sedimentation Pond (MP-01a) to prevent the snow impacted dust sediment from entering Milne Inlet, Arctic Ocean. Continued monitoring and additional cleanup remain ongoing.
    a. On May 23, 2016 BIM commenced clean-up of road sediments located on top of the ice creeks/streams under all 4 bridges crossings along the Tote Road from the Milne Port Site to the Mary River Mine Site to prevent it from entering the creeks/streams. Continued monitoring and cleanup remain ongoing.
    b. On May 22, 2016 mobilized and commenced construction of drainable ditching system at Milne Port Ore Stockpile. Anticipated completion on or before July 17, 2016.
    c. During the week of May 22, 2016 surface water control measures (construction of check dams, capping sections of mine haul road) commenced and remain ongoing.
    d. BIM has commenced work on preparation of plans to address the aforementioned matters, for submission to ECCC and INAC.

22. On June 3, 2016 EO DIDHAM receives email with attachment from Todd Burlingame. The attachment provided supporting written documentation for oral representations from BIM to ECCC. The attachment requested edits to draft FAD which was reviewed earlier that same day during the teleconference oral representations meeting between ECCC and BIM.

MEASURES TO BE TAKEN

Under the authority given to me pursuant to subsection 38(7.1) of the *Fisheries Act*, I hereby direct the persons named above to immediately take all reasonable measures consistent with public safety and with the conservation and protection of fish and fish habitat to prevent the above mentioned occurrence or to counteract, mitigate, or remedy, any adverse effects that result from the above mentioned occurrence or might reasonably be expected to result from it, including:

1. Provide by **June 24, 2016**, a report on the actions taken to address sedimentation issues at the BIM, Mary River Project following the ECCC on-site inspection of May 18-20, 2016 and provide Bi-weekly updates (once every two weeks) of ongoing actions being taken at the site including actions to address issues mentioned in measures to be taken 2 & 3.

2. Provide by **September 30, 2016** a dust mitigation action plan with an implementation schedule addressing crushing operations, wind coming in contact with the crushed rock/iron stock piles, and vehicle traffic on the Tote Road.

3. Provide by **September 30, 2016** a Tote Road and Mine Hall Road mitigation action plan with an implementation schedule addressing sediment water runoff from the road into culverts, ditches, and creeks/streams which leads to David Lake, Mural Lake, Kabikok Lake, KM 32 Lake and KM 27 Lake, Camp Lake, Sheardown Lake, Mary River, and Phillips Creek.

4. Finish constructing by **July 17, 2016** the drainage ditching to the Milne Port Stockpile East Sedimentation Pond (MP05) to allow contact water with the iron ore stockpiles to divert into the Milne Port Stockpile East Sedimentation Pond (MP05) to prevent the contact water from entering Milne Inlet, Arctic Ocean.

5. Finish constructing by **July 17, 2016** the drainage ditching to the Mary Rive Mine Site Iron Ore Stockpile crusher sediment pond (MS06) to allow contact water with the iron ore stockpiles and crusher area to divert into this Sedimentation Pond (MS06) to prevent the contact water from entering Sheardown Lake.

A report on the completion of these measures signed by **Mr Brian Penney** must be submitted in writing to the undersigned Inspector on or before **September 30, 2016.**

Failure to comply with the whole or any part of a Direction is an offence under paragraph 40(3)(g) of the *Fisheries Act*. This Direction is without prejudice to any further action Environment Canada may take with respect to any violation of the *Fisheries Act* including an amended direction or prosecution

THE LAW

Fisheries Act

Deposit of deleterious substance prohibited

36(3) Subject to subsection (4), no person shall deposit or permit the deposit of a deleterious substance of any type in water frequented by fish or in any place under any conditions where the deleterious substance or any other deleterious substance that results from the deposit of the deleterious substance may enter any such water.

Duty to notify – deleterious substance

38(5) If there occurs a deposit of a deleterious substance in water frequented by fish that is not authorized under this Act, or if there is a serious and imminent danger of such an occurrence, and detriment to fish habitat or fish or to the use by humans of fish results or may reasonably be expected to result from the occurrence, then every person shall without delay notify an inspector, a fishery officer or an authority prescribed by the regulations if the person at any material time

(a) owns or has the charge, management or control of
(i) the deleterious substance, or
(ii) the work, undertaking or activity that resulted in the deposit or the danger of the deposit; or
(b) causes or contributes to the occurrence or the danger of the occurrence.

Duty to take corrective measures

38(6) Any person described in paragraph (4)*(a)* or *(b)* or 5(a) or (b) shall, as soon as feasible, take all reasonable measures consistent with public safety and with the conservation and protection of fish and fish habitat to prevent the occurrence or to counteract, mitigate or remedy any adverse effects that result from the occurrence or might reasonably be expected to result from it.

Report

38(7) As soon as feasible after the occurrence or after learning of the danger of the occurrence, the person shall provide an inspector, fishery officer or an authority prescribed by the regulations with a written report on the occurrence or danger of the occurrence.

Corrective measures

38(7.1) If an inspector or fishery officer, whether or not they have been notified under subsection (4) or (5) or provided with a report under subsection (7), is satisfied on reasonable grounds that immediate action is necessary in order to take any measures referred to in subsection (6), the inspector or officer may, subject to subsection (7.2), take any of those measures at the expense of any person described in paragraph (4)(a) or (b) or (5)(a) or (b) or direct such person to take them at that person's expense.

40(2) Every person who contravenes subsection 36(1) or (3) is guilty of an offence and liable

(a) on conviction on indictment,

(i) in the case of an individual,
(A) for a first offence, to a fine of not less than $15,000 and not more than $1,000,000, and
(B) for a second or subsequent offence, to a fine of not less than $30,000 and not more than $2,000,000, or to imprisonment for a term not exceeding three years, or to both,

(ii) in the case of a person, other than an individual or a corporation referred to in subparagraph (iii),
(A) for a first offence, to a fine of not less than $500,000 and not more than $6,000,000, and
(B) for a second or subsequent offence, to a fine of not less than $1,000,000 and not more than $12,000,000, and

(iii) in the case of a corporation that the court has determined to be a small revenue corporation,
(A) for a first offence, to a fine of not less than $75,000 and not more than $4,000,000, and
(B) for a second or subsequent offence, to a fine of not less than $150,000 and not more than $8,000,000; or

(b) on summary conviction,

(i) in the case of an individual,
(A) for a first offence, to a fine of not less than $5,000 and not more than $300,000, and
(B) for a second or subsequent offence, to a fine of not less than $10,000 and not more than $600,000, or to imprisonment for a term not exceeding six months, or to both,

(ii) in the case of a person, other than an individual or a corporation referred to in subparagraph (iii),
(A) for a first offence, to a fine of not less than $100,000 and not more than $4,000,000, and
(B) for a second or subsequent offence, to a fine of not less than $200,000 and not more than $8,000,000, and

(iii) in the case of a corporation that the court has determined to be a small revenue corporation,
(A) for a first offence, to a fine of not less than $25,000 and not more than $2,000,000, and
(B) for a second or subsequent offence, to a fine of not less than $50,000 and not more than $4,000,000.

Other offences

40(3) (*e*)fails to take any reasonable measures that he or she is required to take under subsection 38(6) or fails to take those measures in the required manner, or

(*f*)fails to provide a report that he or she is required to provide under subsection 38(7), or (*g*)fails to comply with the whole or any part of a direction of an inspector or a fishery officer under subsection 38(7.1).

40(3) Every person who

is guilty of an offence punishable on summary conviction and liable, for a first offence, to a fine not exceeding two hundred thousand dollars and, for any subsequent offence, to a fine not exceeding two hundred thousand dollars or to imprisonment for a term not exceeding six months, or to both.

Power to recover costs

42(2) All the costs and expenses referred to in subsection (1) are recoverable by Her Majesty in right of Canada or a province with costs in proceedings brought or taken therefor in the name of Her Majesty in any such right in any court of competent jurisdiction.

Continuing offences

78.1 Where any contravention of this Act or the regulations is committed or continued on more than one day, it constitutes a separate offence for each day on which the contravention is committed or continued.

78.2 Where a corporation commits an offence under this Act, any officer, director or agent of the corporation who directed, authorized, assented to, acquiesced in or participated in the commission of the offence is a party to and guilty of the offence and is liable on conviction to the punishment provided for the offence, whether or not the corporation has been prosecuted.

CONCLUSION

This direction is without prejudice to any further course of action that Environment and Climate Change Canada may take with respect to any violation of the *Fisheries Act*, including an amended Direction, prosecution, or the seeking of an injunction from the court under the *Fisheries Act*, or any other Act.

This direction and the circumstances to which it refers will form part of Environment and Climate Change Canada's records of Baffinland Iron Mines Corporation and its responsible officials, and will be taken into account in future responses to alleged violations and for internal purposes such as setting the frequency of inspections. Environment Canada will consider taking further action if you do not take all necessary corrective steps to comply.

This direction is issued in accordance with the Compliance and Enforcement Policy for the Habitat Protection and Pollution Prevention Provisions of the *Fisheries Act*. The complete text of this policy is available on Environment Canada's website:
http://www.ec.gc.ca/alef-ewe/default.asp?lang=En&n=D6B74D58-1

The complete text of the *Fisheries Act* available on the Department of Justice website : http://laws-lois.justice.gc.ca/Search/

For more information or to respond to the alleged facts contained in this direction, please call or write the undersigned. Your comments will be considered, and where appropriate, a response provided. Any comments you make, as well as Environment Canada's response, will be maintained on file with this direction in Environment Canada's records.

APPENDIX D.7.2

LETTER OF NON-COMPLIANCE (LNC) – INAC

Indigenous and Northern Affairs Canada / Affaires autochtones et du Nord Canada

Letter of Non-Compliance

June 16, 2016

Sylvain Proulx
Chief Operations Officer
Baffinland Iron Mines Corporation Mary River Project
2278 Upper Middle Road East, Suite 300
Oakville, ON L6H 0C3

RE: Letter of Non-Compliance issued to Baffinland Iron Mine's Corporation for non-compliance with Part D Item 4 of Nunavut Water Board Licence 2AM-MRY1325

Background

In June 2015, during a routine Water Licence Inspection at Baffinland Iron Mines Corporation's Mary River Project, it was identified that proper diversion ditches were not installed around the Ore Stockpile Pad at Milne Inlet to divert water into the Ore Stockpile Sedimentation Ponds. These ditches were identified as a priority to prevent sediment water from directly entering the environment. In a follow-up report, BIMC committed to commissioning the ditching system related to this infrastructure prior to freshet 2016.

Furthermore, in August 2015, during a routine Water Licence Inspection, it was identified that there are sections along the Tote Road that require preventative measures to deal with sedimentation because soil conditions along the road are prone to sloughing, excessive wetness and silt loading. In a follow-up report, BIMC has committed to using armour stone in ditches that receive high levels of flow prior to freshet 2016.

During the recent May 2016 Water Licence Inspection, the Ore Stockpile Pad Diversion Ditches and the areas prone to sedimentation along the Tote Road were inspected. It was noted that BIMC has not met the deadline they committed to in June 2015 to complete the diversion ditches leading to the sedimentation ponds at the Ore Stockpile area prior to Freshet 2016; and, that BIMC did not implement significant sedimentation prevention measures along the Tote Road to prevent sediment from entering water.

Justification for why these commitments were not completed was only communicated to the Inspector after the deadline was passed.

Determination

This letter is being issued to BIMC because their commitments to address the sites of concern as identified in previous inspections have not been achieved prior to their deadlines.

It should be noted that since the Inspection in May 2016, BIMC has produced a plan to address the Ore Stockpile Diversion Ditches at Milne Inlet with a completion date by July 17, 2016. This plan was submitted to INAC on May 23, 2016 and this is considered a reasonable approach to address this situation.

BIMC has also committed to producing an Action Plan to address the sedimentation of watercourses along the Tote Road. This plan shall be submitted to the INAC Inspector by June 24, 2016 and will include a schedule of work to be done in 2016 on the Tote Road to specifically deal with the sedimentation of watercourses.

This letter also serves as a warning that further enforcement measures may be taken if reasonable diligence towards meeting the requirement of their licence, Part D Item 4, are not addressed, namely *"The Licensee shall implement sediment and erosion control measures, as required, prior to ensuring all phases of the Mary River Project to prevent and/or minimize sediment loading into water."*

Should you have any questions please contact me at (867) 975-4517.

- D.7 - Removal of Impacted Snow: Milne Beach and Tote Road Bridges

1. Preventative Measures Undertaken Prior to Freshet and May 2016 Regulatory Inspections

1.1. Mine Haul Road

A major program of culvert replacement and riprap installation was completed on the Mine Haul Road between km 105 and km 110 between April 15 and May 15, 2016. The work involved the installation of 525 linear metres of new culverts, and the installation of 4,400 m3 of rip rap in 3.5 km of ditches and on surface slopes located upstream and downstream of seven culvert crossings. The completed work reduces the potential for Mine Haul Road wash out and is designed to effectively and safely convey water from upstream to downstream locations along the Mine Haul Road. A drawing showing the design of the new drainage works as well as series of photos showing culvert installations and riprap installation are presented in Appendix A.1. The work was completed under the guidance of a Professional Engineer, retained by Baffinland, from Golder Associates, and the constructed drainage works are being monitored for operational performance during freshet. Deficiencies identified, if any, during this monitoring will be corrected later in the summer based on recommendations provided by from Golder Associates.

1.2. Other measures

Other measures completed prior to freshet and the May 2016 inspection included a comprehensive program of freshet preparation that included the following components:

- Periodic freshet preparation meetings were held at the Mine Site, coordinated by the Environment Department, from early February until the start of freshet in mid-May. The meetings were held bi-weekly from the April to May period as freshet neared. The meetings were attended by key site managers and superintendents. The meetings were well documented and action items were routinely distributed to all participants for advancement.
- Development of list of high priority stream crossings along the Tote Road that required early snow excavation and culvert clearing. The stream crossings were prioritized based on fisheries considerations and flows (high or low flow).
- The procurement of adequate supply of equipment and supplies to support freshet preparation and response activities. These included the purchase of adequate quantity and types of pumps, hoses, steam jetties, silt fences, silt curtains, and flocculent products.
- The assignment of adequate resources at site for the freshet preparation and management effort including production of rip rap using production crushers, haul trucks, excavators, loaders, and steamers.
- The procurement and assignment of contracted labour for the purpose of culvert clearing and snow removal activities.
- An early start to freshet preparation field activities was initiated during 2016 with the start of field activities in mid-April, well in advance of the start of freshet as follows:
  - Monitoring of any runoff from the ore stockpile perimeters to ensure no discharge to the receiving environment. None has been observed.
  - Clearing of snow from the road surface, embankment, and from areas adjacent to the road to minimize the impact of runoff from road contact water to downstream water bodies.
  - Early excavation and clearing of snow from the inlets and outlets of the stream crossings. Clearing of culverts with steamers as required to ensure.
- The installation of silt fences, flocculent blocks, flocculent netting, and check dams at selected locations.

Frozen and hard packed ground conditions contributed to difficulties in the construction of a drainage system around the perimeter of the Milne Port Ore Stockpile and the Crusher Stockpile areas. Attempts were made but these locations were extremely difficult to excavate during the winter season due to the frozen ground conditions that made penetration with standard excavator near- impossible using standard methods. The project at Milne Port was delayed until the later in May when ground thaw permitted excavation through the developing active layer.

After freshet is over, the results of the 2016 freshet preparation plan will be reviewed and a list of lessons learned will be compiled and corrective actions implemented prior to freshet in 2017.

During 2015, Baffinland retained the services of a flocculent expert, who visited site during August 2015. Based on recommendations made, a quantity of in stream flocculent and other products were purchased for deployment in the event of sediment releases to water bodies.

A monthly fugitive dust monitoring and analytical program was undertaken throughout the year, including the winter season, to track the levels of dust that are deposited at various distances from mining operations. These measurements are an objective means of understanding the levels of dust that are generated from source, transported across site that can become entrained in snow deposits. The dust that becomes entrained in snow can potentially be transported during freshet and this can potentially affect adjacent lakes and streams. The dust monitoring program provides the means to measure changes in potential dust deposition in snow pack.

An Aquatic Effects Monitoring Program and Metal Mining Effluent Regulations Monitoring Program are conducted annually to identify potential changes to water quality, benthos, and fish in downstream water bodies near the Mine Site. The results of the programs during 2016 will identify whether there are any changes to water quality that can be attributed to the specific sediment releases that were reported during the 2016 freshet.

2. Unauthorized Releases and Contributing Factors

A number of unauthorized releases of sediment were reported to Environment Canada, Indigenous and Northern Affairs Canada, and the NT-NU Spill Line during the month of May and June. These included the Spill Report numbers 16-158, 16-176, 16-181, 16-198, 116-202, and 116-202 Update No. 1. A copy of the original Spill Reports are provided in Appendix B. The spill response to these events were resourced substantially at the highest levels within Baffinland management with direct support/involvement from the VP of Sustainability, COO, and CEO.

The major contributing factor to these unanticipated releases included the excessive snowfall, snow pack, and wind events that were observed during 2016. Based on visual observations and anecdotal evidence, the snow pack was much thicker and extensive in 2016 as compared to other years. In addition there were many major wind events during 2016, probably exceeding the number of events that have occurred in recent years' past. The available precipitation and wind data from weather stations will be reviewed for 2016 and compared to previous years to substantiate the visual and anecdotal evidence and included in the Completion Report due September 30, 2016. The thickness and frequency of snow drifting around the project site including the Tote Road, Mine Haul Road, and camp pad areas were extreme and required frequent snow clearing, pushing, and grading activities. This resulted in the removal of surface road materials that became entrained in snow piles adjacent and near the road which were released during the freshet melt. Despite diligent efforts in snow removal and transport, the snow melt that contained road and pad materials melted and were transported to nearby water bodies. The excessive snow pack near the road required the deepening and widening of some of the ditches along the road alignment in order to maintain a transportation link between the two camps for the purpose of safety and transport of provisions. With the commencement of freshet, some of these ditches contributed to limited sediment deposition into nearby water bodies.

A brief warm period in early May resulted in an early onset to freshet that resulted in the unauthorized release reported as 16-158. The quantification of an actual start date of Freshet in a given year can be problematic, as it is often a prolonged event with numerous starts and stalls, dependent on variability of sustained air temperatures. This year there was a brief warm period during the first week of May, followed by fluctuating periods of freeze and thaw. As of the date of this report, freshet is still ongoing with snow pack still being released from the higher elevation areas.

3. Retention of Third Party Expertise

When sediment release events were first observed and reported, third party expertise was retained and these individuals were brought to site. The following expertise was retained:

- Golder Associates - A Senior Geotechnical Engineer was brought to site in late May to study the sedimentation issue with emphasis on best practice for drainage works along the Tote Road, as well as looking at drainage generally across the site. Based on input obtained, a list of action items and areas along the Tote Road was identified and prioritized for action by Baffinland's construction teams. This list of priority areas is provided as Table D.4.2 (Appendix D).
- OPC North – A Construction Manager was retained in late May to lead the actions identified and prioritized along the Tote Road.
- AMEC – A process engineering team was retained to study the effectiveness of various polymers in treating sediment laden waters that were observed along the Mine Haul Road. An intermediate level water treatment professional was brought to site in late May to study the problem and make field and polymer recommendations.
- Kemira Chemical – Samples were sent to Kemira for polymer testing in an effort to continue to identify best potential product to use to settle sediment from the water column. Selected chemical was transported to site to be used in a pilot study. A senior Kemira water quality specialist was brought to site in mid-June to conduct bench and pilot scale field testing on select polymer products for select areas along the Mine Haul Road.
- Le Group Desfor – Road maintenance experts were brought to site in mid-June to provide advice in regard to road maintenance issues.

The input provided will be utilized to develop more detailed action plans related to the Tote Road, Mine Haul Road, and general camp drainage.

4. Water Quality and Acute Toxicity Sampling Results for Areas of Concern

Spill Reports for sediment releases are provided in Appendix B. Potential receivers for the sediment releases include Sheardown Lake, Sheardown Lake Tributary, Camp Lake, Camp Lake Tributaries, Mary River and Mary River Tributaries, David Lake and David Lake Tributaries, Muriel Lake and Muriel Lake Tributaries.

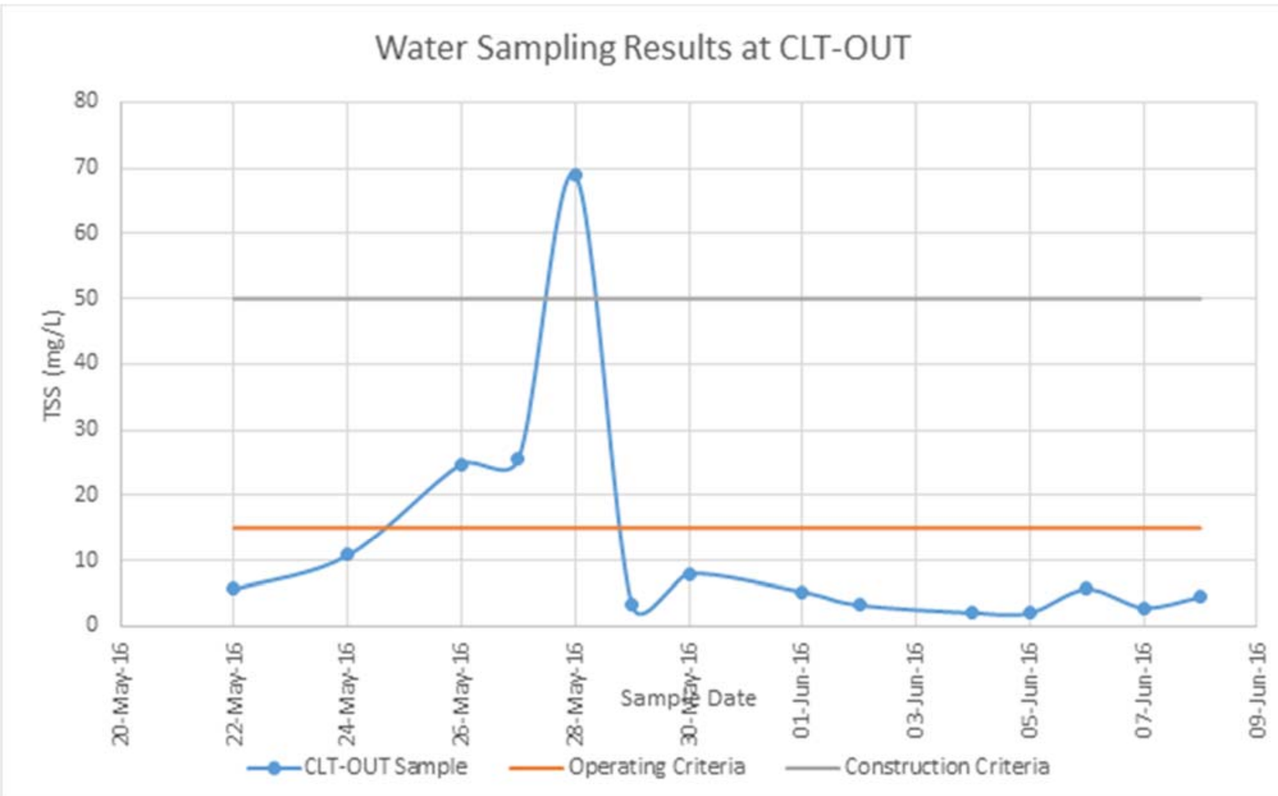
Available water quality and acute toxicity results for Sheardown Lake, Camp Lake, and Mary River systems are provided in Appendix C. GPS coordinates and maps are provided to show approximate sample locations as well as the location of structures that were installed to mitigate the sediment concerns. Water quality data has been compared to the Effluent Quality Discharge Limits for Contact Water (Table 11) provided in the Type "A" Water Licence No. 2AM-MRY1325 for the Mary River Project, which are summarized in the table below:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids	15	30
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Note that in areas where there is or has been active construction, the following effluent discharge limits apply:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids	50	100
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

During the early stages of freshet, there were a number of instances where water samples exceeded the Discharge Criteria for Total Suspended Solids (TSS) but as the incident response measures were implemented, the majority of the discharge samples taken have met the discharge criteria. As an example, the graph below shows the TSS levels from samples at the Camp Lake Tributary #1 sampling point (CLT-OUT) where the levels of TSS were elevated for several sampling events and then decreased to below the Discharge Criteria as mitigation measures were implemented. A similar trend was observed for the other stream outflows sampled.



In addition, all samples collected for Acute Toxicity analysis have shown non-lethal results from the discharge water.

Water sampling will continue on a regular basis, where it is safe to collect samples, and additional data will be included in the bi-weekly update reports.

5. Corrective Measures for Reported Spills and Other Concerns

5.1. Immediate actions undertaken to address issues

A number of immediate actions were undertaken to address sediment releases to water bodies that were documented in the Spill Reports submitted to authorities. These actions were completed in accordance with the current Surface Water and Aquatic Systems Management Plan (dated March 2016) and are more fully detailed in Appendix D. In summary, the immediate actions undertaken included the following:

- Silt fence installation.
- Silt curtain installation.
- Flocculent installation and addition to the water flow.
- Check dam construction and operation.
- Gravity and flocculent assisted settling of solids from the water column.
- Redirection of sediment / turbid waters away from fish habitat by means of ditches, swales, and pumping.

In the case of the Milne Ore Pad drainage and collection system, construction of ditches commenced in late May. Ongoing sampling of the areas downstream of the Ore Pad stockpile indicated there was negligible impact from potential ore pad runoff. Prior to the construction of ditches around the ore pad, there were no visible flows discharging from the ore stockpile pad.

Impacted snow located along the Milne Port beach area, west of the ore loader area was excavated and stockpiled at a secure location away from fish habitat.

Attempts were made to clear snow under the bridges along the Tote Road, and the surface of the bridges were cleared of muddy material by means of manual methods.

5.2. Detailed work completed by area of concern

Refer to Appendix D for detailed list of actions taken during the reporting period, photos, and supplementary materials for each sediment release and area of concern:

Appendix D.1: Spill Report 16-158 - Sheardown Lake Tributaries and Sheardown Lake.
Appendix D.2: Spill Report 16-176 - Camp Lake Tributaries and Camp Lake.
Appendix D.3: Spill Report 16-181- Mine Haul Road to Mary River and Sheardown Lake Tributary.
Appendix D.4: Spill Report 16-198 - Camp Lake Tributary 1
Appendix D.5: Spill Report 16-202 and Update No. 1 - Milne Inlet Tote Road, Tributaries to Mary Lake, David Lake, and Muriel Lake.
Appendix D.6: Milne Port Ore Stockpile Drainage Collection System.
Appendix D.7: Milne Port Beach
Appendix D.8: Sediment on and under bridges along Tote Road.

6. Next Steps

6.1. Bi-weekly update reports

Bi-weekly update reports will be provided including any additional construction work completed and additional water sampling data. The next report will cover the period from June 18 to July 1, 2016.

6.2. Completed construction repairs

Construction repairs for the areas of concern including the Milne Port Ore Stockpile Drainage system and the Mine Site Crusher Stockpile Pad will be substantially completed by July 17, 2016.

6.3. Lessons-learned

Baffinland will conduct an extensive review and analyses of lessons- learned with regard to sedimentation issues along the roads and at the camps. Key conclusions and recommendations will be provided in the Completion Report which will be provided to regulators and inspectors. Baffinland will be open to any comments and recommendations received and will make revisions as is appropriate.

6.4. Long-term action plans

Longer term action plans related to dust mitigation and Tote Road work as related to drainage considerations will be provided by September 30, 2016.

6.5. Completion Report

A completion report that summarizes the results of all work to date and is signed off by the CEO of the company will be provided by September 30, 2016.

On Saturday, May 7, 2016, a snowmelt event occurred at the Mine Site. Runoff containing sediments and discoloured water were observed to flow into Sheardown Tributary and Sheardown Lake at around 1900 HRS. The source of the suspected off-spec drainage was dirty snow located downwind of the Crusher Pad. The event resulted in some siltation/discoloured water in two streams flowing from adjacent areas onto and under the ice of Sheardown Lake. In accordance with the Surface Water Management Plan, controls were implemented that included installation of silt fences and the deployment of flocculent and treated jute to settle sediments prior to discharge. Further actions are planned that will reduce the potential impact from the dirty snow source area. Dirty snow removal, check dam/sump construction, and additional flocculation are being considered. Daily monitoring of the water quality and flow is ongoing. Spill report updates will be provided as warranted. A follow-up report documenting the occurrence and providing recommendations will be submitted within 30 days

On Tuesday, May 17, 2016, runoff containing sediments was observed to be flowing into Camp Lake Tributary # 1 and into Camp Lake around 0900 HRS. The source of the off-spec drainage was from an area adjacent to the airstrip. The event resulted in some siltation to the stream flowing into Camp Lake. In accordance with the Surface Water Management Plan, controls were implemented that included installation rip rap (6" aggregate) and the deployment of flocculent and treated jute to settle sediments prior to discharge. Further actions are planned that will reduce the potential impact from the source area. Spill report updates will be provided as warranted.

A follow-up report documenting the occurrence and providing recommendations will be submitted within 30 days

K ADDITIONAL INFORMATION, COMMENTS, ACTIONS PROPOSED OR TAKEN TO CONTAIN, RECOVER OR DISPOSE OF SPILLED PRODUCT AND CONTAMINATED MATERIALS

On May 20 and 21, 2016, runoff containing sediment was observed to be flowing from the surface of the Mine Haul Road through several breaks (punch outs) on the outer edge of the road. The punch outs were installed to allow contact water on the road surface to be efficiently discharged from the road surface. On the afternoon of May 19, discharges of contact water increased and it became apparent that there was risk to Mary River and Sheardown tributary/Lake. The berm punch outs were sealed and road contact water has been diverted to three selected locations that will minimize potential flows to downstream fish habitat and water bodies. Check dams, silt fences/curtains, floculants are being utilized to assist with this initial effort. It is expected that the sediment will settle and will be discharged back to the receiving environment. Report updates will be provided with further information in the near future. This incident is being reported as required by the conditions of Water Licence No. 2AM-MRY1325 and as required by subsection 38(4) of the Fisheries Act.

On Sunday, May 29, 2016, during an environmental inspection of Mine Site drainages a deposit of sediments was discovered in Camp Lake Tributary #1 (CLT1), south of the Tote Road. Upon initial investigation, the source of the sediment was from a stream bank failure. The embankment failure may have been caused by water draining from the airstrip. The event resulted in sandy deposit of material that partially encroached on the stream. Once discovered, silt fences were erected around the sediment deposit. A schedule is being developed for the removal of the sediment and stabilization of the stream embankment at that location. The water will be rerouted from this location and redirected to an area that is more stable. The material is coarse sand and does not appear to be mobile in water. A follow-up report documenting the occurrence and providing recommendations will be submitted within 30 days.

K ADDITIONAL INFORMATION, COMMENTS, ACTIONS PROPOSED OR TAKEN TO CONTAIN, RECOVER OR DISPOSE OF SPILLED PRODUCT AND CONTAMINATED MATERIALS

During an environmental inspection of the Milne Tote Road on May 31, three locations were observed where there was turbid water and sediment present in culvert outlet locations. These locations were stream crossings CV-223 at km 97, BG-17 at km 90, and BG-29 at km 85. The source of the sediment is erosion from spring freshet. There are no fish present at these locations because flows are very low and fish have not yet started to move into the stream. In the meantime silt fences and in-ditch flocculant have been deployed as appropriate Sediments in culvert outlet basins will be carefully excavated and removed under the supervision of Environment staff within the next several days. In addition, the embankment areas of these streams are scheduled to receive riprap/geotextile shortly.

K ADDITIONAL INFORMATION, COMMENTS, ACTIONS PROPOSED OR TAKEN TO CONTAIN, RECOVER OR DISPOSE OF SPILLED PRODUCT AND CONTAMINATED MATERIALS

During an environmental inspection of the Milne Tote Road on June 18, two locations were observed where there was turbid water and sediment present near stream crossings, downstream of Tote Road. These locations were BG-31 at km 82 and BG-28 at km 86.3. The sediment appears to be generated by the melting snow pack adjacent to the road. The streams are not expected to be fish habitat, although flow from these locations is to Muriel Lake (BG-31) and David Lake (BG-28). The sediment is being controlled from entering the lakes at these locations by the construction of check dams and silt curtain for stream BG-31 and by silt fence and silt curtain at BG-28. Previous locations where there was sediment and turbid water at stream crossings CV-223 at km 97, BG-17 at km 90, and BG-29 at km 85, are now running clear and sediment at culvert outlets was removed.

D.6 - Milne and Mine Site Drainage Works
D.7 - Removal of Impacted Snow: Milne Beach and Tote Road Bridges

Report Basis

The document provided, herein, is the first bi-weekly progress report as required under the June 7 Fisheries Direction provided by Environment Canada (page 6, Measures to be Taken, Item 1) and reports on the period June 25 through July 8. Specifically, the bi-weekly reports are to provide updates on the actions taken to address sedimentation issues and ongoing actions being taken at the site to address Items 2 and 3 as outlined in the Fisheries Direction. Previous actions, including pre-freshet actions, were reported on in the June 24th, 2016, Report on Actions Taken.

1. Unauthorized Releases and Contributing Factors

A number of unauthorized releases of sediment were reported to Environment Canada, Indigenous and Northern Affairs Canada, and the NT-NU Spill Line during the month of May and June. These included the Spill Report numbers 16-158, 16-176, 16-181, 16-198, 116-202, and 116-202 Update No. 1. Copies of the original Spill Reports are provided in Appendix A. During the current reporting period, there were no further unauthorized sediment releases.

As of July 8, the potentially affected drainages continue to run visually clear of sediment, and the residual snow pack in upstream areas has been substantially released. Based on visual observations, Freshet flows have peaked and is now waning. Lake ice is still present on the larger lakes of the area (Camp Lake, Sheardown Lake, David Lake, Muriel Lake, and Mary Lake) but there is significant melt out from the shorelines. There were no significant rainfall or snowfall events during the reporting period.

2. Retention of Third Party Expertise

When sediment release events were first observed and reported, third party expertise was retained and these individuals were brought to site. A list of those individuals and support provided was detailed in the June 24th, 2016, Report on Actions Taken. We continue discussions with those various individuals to provide advice as warranted. During the reporting period, the following consultants/contractors visited site and provided assistance.

- Nuna East Ltd. - A Construction Engineer and Construction Team from Nuna East Ltd. constructed/installed additional sedimentation control structures along the Mine Haul Road and Tote Road during the reporting period. These areas requiring work were further developed based on observed conditions during freshet. This list of additional priority areas is provided as Table C.4.2 (Appendix C).
- AMEC Foster Wheeler and Kemira Chemical – A process engineering team was retained to continue to study and test the effectiveness of various polymers in treating sediment laden waters that were observed along the Mine Haul Road. Intermediate level water treatment professionals continue to be brought to site over the reporting period in late May to further study the viability polymer treatment of sediment-impacted runoff waters. Several polymers have been selected for further study and procurement.

3. Water Quality and Acute Toxicity Sampling Results for Areas of Concern

Spill Reports for sediment releases are provided in Appendix A. Potential receivers for the sediment releases included Sheardown Lake, Sheardown Lake Tributary, Camp Lake, Camp Lake Tributaries, Mary River and Mary River Tributaries, David Lake and David Lake Tributaries, Muriel Lake and Muriel Lake Tributaries.

Available water quality and acute toxicity results for Sheardown Lake, Camp Lake, and Mary River systems are provided in Appendix B. These results include results provided in the June 24 initial report as well as any new results reported during the current reporting period. GPS coordinates and maps are provided to show approximate sample locations as well as the location of structures that were installed to mitigate the sediment concerns. Water quality data has been compared to the Effluent Quality Discharge Limits for Contact Water (Table 11) provided in the Type “A” Water Licence No. 2AM-MRY1325 for the Mary River Project, which are summarized in the table below:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	15	30
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Note that in areas where there is or has been active construction, the following effluent discharge limits apply:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	50	100
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

During the current June 25 to July 8 reporting period, there were no exceedances of the Type A Water Licence criteria. A number of laboratory TSS and turbidity results remain in progress (IP). These include results from Mary River (upstream and downstream), and at various stream crossings along the Tote Road (upstream and downstream) where there were unauthorized releases. Field turbidity values for the Tote Road stream crossings are available and included in Appendix B.

Due to the excellent water quality results over the reporting period for the areas of concern, further acute toxicity analyses was not performed. Previous acute toxicity analyses have shown non-lethal results from the discharge water samples that were collected and reported previously.

Water sampling will continue on a regular basis, and additional data, including laboratory results that are in progress for this reporting period, will be included in future bi-weekly update reports.

4. Corrective Measures for Reported Spills and Other Concerns

4.1. Immediate actions undertaken to address issues

A number of immediate actions were undertaken to address sediment releases to water bodies that were documented in the Spill Reports submitted to authorities. These actions were presented previously in the June 24th, 2016, Report on Actions Taken.

In the case of the Milne Ore Pad drainage and collection system, construction of ditches commenced in late May and were substantially completed in mid-June. The ditching system is currently functional and performance is under observation and assessment. A Hatch Consulting representative completed a site tour of the facility for the purpose of collection of data for the purpose of the as-built construction documents. Secondary ditch, berm, and swale construction for Mine Site Crusher Stockpile area was in progress during the reporting period. Primary/main ditch construction was completed during 2015.

4.2. Detailed work completed by area of concern

Any new work actions taken during the June 25 to July 8 reporting period for the areas of concern are provided in Appendix C. Actions, if taken, are appended to the overall action list provided in the previous work action lists. In addition, new photos for the current reporting period are provided as warranted.

Appendix C.1: Spill Report 16-158 - Sheardown Lake Tributaries and Sheardown Lake.
Appendix C.2: Spill Report 16-176 - Camp Lake Tributaries and Camp Lake.

Appendix C.3: Spill Report 16-181- Mine Haul Road to Mary River and Sheardown Lake Tributary.
Appendix C.4: Spill Report 16-198 - Camp Lake Tributary 1
Appendix C.5: Spill Report 16-202 and Update No. 1 - Milne Inlet Tote Road, Tributaries to Mary Lake, David Lake, and Muriel Lake.
Appendix C.6: Milne Port Ore Stockpile Drainage Collection System.
Appendix C.7: Milne Port Beach
Appendix C.8: Sediment on and under bridges along Tote Road.

5. Next Steps

5.1. Bi-weekly update reports

Bi-weekly update reports will continue to be provided including any additional construction work completed and additional water sampling data. The next report will cover the period from July 9 to July 22, 2016.

5.2. Completed construction repairs

Construction repairs for the areas of concern including the Milne Port Ore Stockpile Drainage system and the Mine Site Crusher Stockpile Pad will be substantially completed by July 17, 2016.

5.3. Lessons-learned

Baffinland will conduct an extensive review and analyses of lessons- learned with regard to sedimentation issues along the roads and at the camps. Key conclusions and recommendations will be provided in the Completion Report which will be provided to regulators and inspectors. Baffinland will be open to any comments and recommendations received and will make revisions as is appropriate.

5.4. Long-term action plans

Longer term action plans related to dust mitigation and Tote Road work as related to drainage considerations will be provided by September 30, 2016.

5.5. Completion Report

A completion report that summarizes the results of all work to date and is signed off by the CEO of the company will be provided by September 30, 2016.

Report Basis

The document provided, herein, is the second bi-weekly progress report as required under the June 7 Fisheries Direction provided by Environment Canada (page 6, Measures to be Taken, Item 1) and reports on the period July 9 through July 22. Specifically, the bi-weekly reports are to provide updates on the actions taken to address sedimentation issues and ongoing actions being taken at the site to address Items 2 and 3 as outlined in the Fisheries Direction. Previous actions, including pre-freshet actions, were reported on in the June 24th, 2016, Report on Actions Taken and July 8 Bi-Weekly Report No. 1.

1. Unauthorized Releases and Contributing Factors

A number of unauthorized releases of sediment were reported to Environment Canada, Indigenous and Northern Affairs Canada, and the NT-NU Spill Line during the month of May and June. These included the Spill Report numbers 16-158, 16-176, 16-181, 16-198, 116-202, and 116-202 Update No. 1. Copies of the original Spill Reports are provided in Appendix A. During the current reporting period, there were no further unauthorized sediment releases.

As of July 22, the potentially affected drainages continue to run visually clear of sediment, and the residual snow pack in upstream areas have been fully released. Based on visual observations, Freshet flows have subsided. Lake ice is no longer present on the larger lakes of the area (Camp Lake, Sheardown Lake, David Lake, Muriel Lake, and Mary Lake). There were minor rainfall events during the reporting period.

2. Retention of Third Party Expertise

When sediment release events were first observed and reported, third party expertise was retained and these individuals were brought to site. A list of those individuals and support provided was detailed in the June 24th, 2016, Report on Actions Taken. We continue discussions with those various individuals to provide advice as warranted. During the reporting period, the following consultants/contractors provided assistance:

- Nuna East Ltd. - A Construction Team consisting of Nuna East Ltd. Equipment operator supported by Baffinland Mine Operations personnel continued to work on completion of the Mine Crusher Pad ditching project.
- Technical advisors from AMEC Foster Wheeler and Kemira Chemical were available to site personnel during the reporting period for the purpose of providing technical guidance on water treatment of runoff if required. However, their services were not required during the reporting period due to the clear flows.
- Initial consultation with Golder and AMEC Foster Wheeler has taken place to discuss the Dust Mitigation Action Plan and the Tote Road and Mine Hall Road Mitigation Action Plan.

3. Water Quality and Acute Toxicity Sampling Results for Areas of Concern

Spill Reports for sediment releases are provided in Appendix A. Potential receivers for the sediment releases included Sheardown Lake, Sheardown Lake Tributary, Camp Lake, Camp Lake Tributaries, Mary River and Mary River Tributaries, David Lake and David Lake Tributaries, Muriel Lake and Muriel Lake Tributaries.

Available water quality and acute toxicity results for Sheardown Lake, Camp Lake, and Mary River systems are provided in Appendix B. These results include data provided in the June 24 and July 8 reports, as well as new results that became available during the current reporting period. New sampling locations with corresponding laboratory results include the Mary River (upstream and downstream of the Mine Site), and various stream crossings along the Tote Road (upstream and downstream of the road) where unauthorized releases were reported. GPS coordinates and maps are provided to show approximate sample locations as well as the location of structures that were installed to mitigate the sediment concerns.

Water quality results have been compared to the Effluent Quality Discharge Limits for Contact Water (Table 11) provided in the Type "A" Water Licence No. 2AM-MRY1325 for the Mary River Project, which are summarized in the table below:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	15	30
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Note that in areas where there is or has been active construction, the following effluent discharge limits apply:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	50	100
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

During the current July 9 to July 22 reporting period, there were no exceedances of the Type A Water Licence criteria. Due to the excellent water quality results over the reporting period for the areas of concern, further acute toxicity analyses was not performed. Previous acute toxicity analyses have shown non-lethal results from the discharge water samples that were collected and reported previously.

Water sampling will continue on a periodic basis, and additional data, including laboratory results that are in progress for this reporting period, will be included in future bi-weekly update reports.

4. Corrective Measures for Reported Spills and Other Concerns

4.1. Immediate actions undertaken to address issues

A number of immediate actions were undertaken to address sediment releases to water bodies that were documented in the Spill Reports submitted to authorities. These actions were presented previously in the June 24th and July 8, 2016, Report on Actions Taken.

In the case of the Milne Ore Pad and the Mine Site Ore Pad drainage and collection systems, construction of ditch systems were completed by June 15 and July 15, respectively. As of those dates, the ditching systems were functional and currently performance is under observation and evaluation. Construction Summary Reports (CSRs) for the facilities are currently in preparation and will be submitted to the Nunavut Water Board within three months after the substantial completion of construction.

4.2. Detailed work completed by area of concern

Any new work actions taken during the July 9 to July 22 reporting period for the areas of concern are provided in Appendix C. Actions, if taken, are appended to the overall action list provided in the previous work action lists. In addition, new photos for the current reporting period are provided as warranted. Appendix C is subdivided as follows:

Appendix C.1: Spill Report 16-158 - Sheardown Lake Tributaries and Sheardown Lake.
Appendix C.2: Spill Report 16-176 - Camp Lake Tributaries and Camp Lake.
Appendix C.3: Spill Report 16-181- Mine Haul Road to Mary River and Sheardown Lake Tributary.
Appendix C.4: Spill Report 16-198 - Camp Lake Tributary 1

Appendix C.5: Spill Report 16-202 and Update No. 1 - Milne Inlet Tote Road, Tributaries to Mary Lake, David Lake, and Muriel Lake.
Appendix C.6: Milne Port Ore Stockpile Drainage Collection System.
Appendix C.7: Milne Port Beach
Appendix C.8: Sediment on and under bridges along Tote Road.

5. Next Steps

5.1. Bi-weekly update reports

Bi-weekly update reports will continue to be provided including any additional construction work completed and additional water sampling data. The next report will cover the period from July 23 to August 5, 2016.

5.2. Completed construction repairs

Construction repairs for the areas of concern including the Milne Port Ore Stockpile Drainage system and the Mine Site Crusher Stockpile Pad have been substantially completed by the established July 17, 2016, deadline.

5.3. Lessons-learned

Baffinland will conduct an extensive review and analyses of lessons- learned with regard to sedimentation issues along the roads and at the camps. Key conclusions and recommendations will be provided in the Completion Report which will be provided to regulators and inspectors. Baffinland will be open to any comments and recommendations received and will make revisions as appropriate.

5.4. Long-term action plans

Longer term action plans related to Dust Mitigation and Tote Road Action Plans as related to drainage considerations are underway and will be provided by September 30, 2016.

5.5. Completion Report

A completion report that summarizes the results of all work to date and is signed off by the CEO of the company will be provided by September 30, 2016.

C.6 - Milne and Mine Site Drainage Works
C.7 - Removal of Impacted Snow: Milne Beach and Tote Road Bridges

Report Basis

The document provided, herein, is the third -bi-weekly progress report as required under the June 7 Fisheries Direction provided by Environment Canada (page 6, Measures to be Taken, Item 1) and reports on the period July 23 through August 5. Specifically, the bi-weekly reports are to provide updates on the actions taken to address sedimentation issues and ongoing actions being taken at the site to address Items 2 and 3 as outlined in the Fisheries Direction. Previous actions, including pre-freshet actions, were reported on in the June 24th, 2016, Report on Actions Taken and the July 8 and July 22 Bi-Weekly Reports Nos. 1 and 2.

1. Unauthorized Releases and Contributing Factors

A number of unauthorized releases of sediment were reported to Environment Canada, Indigenous and Northern Affairs Canada, and the NT-NU Spill Line during the month of May and June. These included the Spill Report numbers 16-158, 16-176, 16-181, 16-198, 116-202, and 116-202 Update No. 1. Copies of the original Spill Reports are provided in Appendix A. During the current reporting period, there were no further unauthorized sediment releases reported.

As of August 5, the potentially affected drainages continue to run, for the most part, visually clear of sediment. There were moderate rainfall events during the reporting period which resulted is some minor turbidity in Camp Lake Tributary and tributaries discharging to Mary River, especially during the early August period. Sampling has been completed for this period and results are forthcoming and will be provided in the next bi-weekly report. A natural sedimentation event, unrelated to Project activities, occurred upstream on Mary River (10 km upstream of Deposit No. 1) during the reporting period, causing the waters of Mary River to flow visually brown in colour in the vicinity of the Mine Site.

2. Retention of Third Party Expertise

When sediment release events were first observed and reported, third party expertise was retained and these individuals were brought to site. A list of those individuals and support provided was detailed in the June 24th, 2016, Report on Actions Taken. We continue discussions with those various individuals to provide advice as warranted. During the reporting period, the following consultants/contractors provided assistance:

- In early August, Golder was selected as the key consultant to support Baffinland in the development of the Dust Mitigation Action Plan and the Tote Road and Mine Haul Road Mitigation Action Plans.

3. Water Quality and Acute Toxicity Sampling Results for Areas of Concern

Spill Reports for sediment releases are provided in Appendix A. Potential receivers for the sediment releases included Sheardown Lake, Sheardown Lake Tributary, Camp Lake, Camp Lake Tributaries, Mary River and Mary River Tributaries, David Lake and David Lake Tributaries, Muriel Lake and Muriel Lake Tributaries.

Available water quality and acute toxicity results for Sheardown Lake, Camp Lake, and Mary River systems are provided in Appendix B. These results include data provided in the June 24, July 8, and July 22 reports, as well as new results that became available during the current reporting period. GPS coordinates and maps are provided to show approximate sample locations as well as the location of structures that were installed to mitigate the sediment concerns.

Water quality results have been compared to the Effluent Quality Discharge Limits for Contact Water (Table 11) provided in the Type "A" Water Licence No. 2AM-MRY1325 for the Mary River Project, which are summarized in the table below:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	15	30
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Note that in areas where there is or has been active construction, the following effluent discharge limits apply:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	50	100
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

During the current July 23 to August 5 reporting period, there were no exceedances of the Type A Water Licence criteria. Minor turbid conditions were observed along Camp Lake Tributary outlet, however, water samples from early August period were not available for this location for inclusion in this report. These results will be included during the next reporting period.

Due to the acceptable water quality results over the reporting period for the areas of concern, further acute toxicity analyses was not performed. Previous acute toxicity analyses have shown non-lethal results from the discharge water samples that were collected and reported previously.

Water sampling will continue on a periodic basis, and additional data, including laboratory results that are in progress for this reporting period, will be included in future bi-weekly update reports.

4. Corrective Measures for Reported Spills and Other Concerns

4.1. Immediate actions undertaken to address issues

A number of immediate actions were undertaken to address sediment releases to water bodies that were documented in the Spill Reports submitted to authorities. These actions were presented previously in the reports provided on June 24, July 8, and July 22, 2016 (Reports on Actions Taken).

In the case of the Milne Ore Pad and the Mine Site Ore Pad drainage and collection systems, construction of ditch systems were completed by June 15 and July 15, respectively. As of those dates, the ditching systems were functional and currently performance is under observation and evaluation. Construction Summary Reports (CSRs) for the facilities are currently in preparation and will be submitted to the Nunavut Water Board within three months after the substantial completion of construction.

4.2. Detailed work completed by area of concern

Any new work actions taken during the July 23 to August 5 reporting period for the areas of concern are provided in Appendix C. Actions, if taken, are appended to the overall action list provided in the previous work action lists. In addition, new photos for the current reporting period are provided as warranted. Appendix C is subdivided as follows:

Appendix C.1: Spill Report 16-158 - Sheardown Lake Tributaries and Sheardown Lake.
Appendix C.2: Spill Report 16-176 - Camp Lake Tributaries and Camp Lake.
Appendix C.3: Spill Report 16-181- Mine Haul Road to Mary River and Sheardown Lake Tributary.
Appendix C.4: Spill Report 16-198 - Camp Lake Tributary 1
Appendix C.5: Spill Report 16-202 and Update No. 1 - Milne Inlet Tote Road, Tributaries to Mary Lake, David Lake, and Muriel Lake.
Appendix C.6: Milne Port Ore Stockpile Drainage Collection System.
Appendix C.7: Milne Port Beach
Appendix C.8: Sediment on and under bridges along Tote Road.

5. Next Steps

5.1. Bi-weekly update reports

Bi-weekly update reports will continue to be provided including any additional construction work completed and additional water sampling data. The next report will cover the period from August 6 to 19, 2016.

5.2. Completed construction repairs

Construction repairs for the areas of concern including the Milne Port Ore Stockpile Drainage system and the Mine Site Crusher Stockpile Pad have been substantially completed by the established July 17, 2016, deadline.

5.3. Lessons-learned

Baffinland will conduct an extensive review and analyses of lessons- learned with regard to sedimentation issues along the roads and at the camps. Key conclusions and recommendations will be provided in the Completion Report which will be provided to regulators and inspectors. Baffinland will be open to any comments and recommendations received and will make revisions as is appropriate.

5.4. Long-term action plans

Longer term action plans related to dust mitigation and Tote Road work as related to drainage considerations are underway and will be provided by September 30, 2016.

5.5. Completion Report

A completion report that summarizes the results of all work to date and is signed off by the CEO of the company will be provided by September 30, 2016.

Report Basis

The document provided, herein, is the fourth bi-weekly progress report as required under the June 7 Fisheries Direction provided by Environment Canada (page 6, Measures to be Taken, Item 1) and reports on the period August 6 through August 19. Specifically, the bi-weekly reports are to provide updates on the actions taken to address sedimentation issues and ongoing actions being taken at the site to address Items 2 and 3 as outlined in the Fisheries Direction. Previous actions, including pre-freshet actions, were reported on in the June 24th, 2016, Report on Actions Taken and subsequent Bi-Weekly Reports Nos. 1 to 3, incl.

1. Unauthorized Releases and Contributing Factors

A number of unauthorized releases of sediment were reported to Environment Canada (EC), Indigenous and Northern Affairs Canada (INAC), and the NT-NU Spill Line during the months of May and June. These included the Spill Report numbers 16-158, 16-176, 16-181, 16-198, 116-202, and 116-202 Update No. 1. Copies of the original Spill Reports are provided in Appendix A. During the current reporting period, there were no further unauthorized sediment releases reported.

As of August 19, the potentially affected drainages continue to run, for the most part, visually clear of sediment. There were moderate rainfall events during the reporting period which resulted is some minor turbidity in Camp Lake Tributary and tributaries discharging to Mary River, especially during the first week of August. Monitoring results for early August are included in this report.

2. Retention of Third Party Expertise

When sediment release events were first observed and reported, third party expertise was retained and these individuals were brought to site. A list of those individuals and support provided was detailed in the June 24th, 2016, Report on Actions Taken. We continue discussions with those various individuals to provide advice as warranted. During the reporting period, the following consultants/contractors provided assistance:

- In early August, Golder was selected as the key consultant to support Baffinland in the development of the Dust Mitigation Action Plan and the Tote Road and Mine Haul Road Mitigation Action Plans.
- During the period August 12 to 16, drainage and dust specialists visited the site to conduct an assessment of site conditions and to consult with on-site managers regarding the development and implementation of the proposed action plans.
- A water treatment specialist from AMEC Foster Wheeler was on site during the first week of August to assist with polymer treatment testing in the field.

3. Water Quality and Acute Toxicity Sampling Results for Areas of Concern

Spill Reports for sediment releases are provided in Appendix A. Potential receivers for the sediment releases included Sheardown Lake, Sheardown Lake Tributary, Camp Lake, Camp Lake Tributaries, Mary River and Mary River Tributaries, David Lake and David Lake Tributaries, Muriel Lake and Muriel Lake Tributaries.

Available water quality and acute toxicity results for Sheardown Lake, Camp Lake, and Mary River systems are provided in Appendix B. These results include data provided in the previous reports covering the period up to August 5, 2016, as well as new results that became available during the current reporting period. GPS coordinates and maps are provided to show approximate sample locations as well as the location of structures that were installed to mitigate the sediment concerns.

Water quality results have been compared to the Effluent Quality Discharge Limits for Contact Water (Table 11) provided in the Type "A" Water Licence No. 2AM-MRY1325 for the Mary River Project, which are summarized in the table below:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	15	30
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Note that in areas where there is or has been active construction, the following effluent discharge limits apply:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	50	100
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

During the current August 6 to 19 reporting period, there were no exceedances of the Type A Water Licence criteria.

Due to the acceptable water quality results over the reporting period for the areas of concern, further acute toxicity analyses was not performed. Previous acute toxicity analyses have shown non-lethal results from the discharge water samples that were collected and reported previously.

Water sampling will continue on a periodic basis, and additional data, including laboratory results that are in progress for this reporting period, will be included in future bi-weekly update reports.

4. Corrective Measures for Reported Spills and Other Concerns

4.1. Immediate actions undertaken to address issues

A number of immediate actions were undertaken to address sediment releases to water bodies that were documented in the Spill Reports submitted to authorities. These actions were presented previously in previous Reports on Actions Taken.

In the case of the Milne Ore Pad and the Mine Site Ore Pad drainage and collection systems, construction of ditch systems were completed by June 15 and July 15, respectively. As of those dates, the ditching systems were functional and currently performance is under observation and evaluation. Construction Summary Reports (CSRs) for the facilities are currently in preparation and will be submitted to the Nunavut Water Board within three months after the substantial completion of construction.

4.2. Detailed work completed by area of concern

Any new work actions taken during the August 6 to August 19 reporting period for the areas of concern are provided in Appendix C. Actions, if taken, are appended to the overall action list provided in the previous work action lists. In addition, new photos for the current reporting period are provided as warranted. Appendix C is subdivided as follows:

Appendix C.1: Spill Report 16-158 - Sheardown Lake Tributaries and Sheardown Lake.
Appendix C.2: Spill Report 16-176 - Camp Lake Tributaries and Camp Lake.

Appendix C.3: Spill Report 16-181- Mine Haul Road to Mary River and Sheardown Lake Tributary.
Appendix C.4: Spill Report 16-198 - Camp Lake Tributary 1
Appendix C.5: Spill Report 16-202 and Update No. 1 - Milne Inlet Tote Road, Tributaries to Mary Lake, David Lake, and Muriel Lake.
Appendix C.6: Milne Port Ore Stockpile Drainage Collection System.
Appendix C.7: Milne Port Beach
Appendix C.8: Sediment on and under bridges along Tote Road.

5. Next Steps

5.1. Bi-weekly update reports

Bi-weekly update reports will continue to be provided including any additional construction work completed and additional water sampling data. The next report will cover the period from August 20 to September 2, 2016.

5.2. Completed construction repairs

Construction repairs for the areas of concern including the Milne Port Ore Stockpile Drainage system and the Mine Site Crusher Stockpile Pad have been substantially completed by the established July 17, 2016, deadline.

5.3. Lessons-learned

Baffinland will conduct an extensive review and analyses of lessons- learned with regard to sedimentation issues along the roads and at the camps. Key conclusions and recommendations will be provided in the Completion Report which will be provided to regulators and inspectors. Baffinland will be open to any comments and recommendations received and will make revisions as is appropriate.

5.4. Long-term action plans

Longer term action plans related to dust mitigation and Tote Road work as related to drainage considerations are underway and will be provided by September 30, 2016.

5.5. Completion Report

A completion report that summarizes the results of all work to date and is signed off by the CEO of the company will be provided by September 30, 2016.

C.6 – Milne and Mine Site Drainage Works
C.7 – Removal of Impacted Snow: Milne Beach and Tote Road Bridges

Report Basis

The document provided, herein, is the fifth bi-weekly progress report as required under the June 7 Fisheries Direction provided by Environment Canada (page 6, Measures to be Taken, Item 1) and reports on the period August 20th through September 2nd. Specifically, the bi-weekly reports are to provide updates on the actions taken to address sedimentation issues and ongoing actions being taken at the site to address Items 2 and 3 as outlined in the Fisheries Direction. Previous actions, including pre-freshet actions, were reported on in the June 24th, 2016, Report on Actions Taken and subsequent Bi-Weekly Reports Nos. 1 to 4, incl.

1. Unauthorized Releases and Contributing Factors

A number of unauthorized releases of sediment were reported to Environment Canada (EC), Indigenous and Northern Affairs Canada (INAC), and the NT-NU Spill Line during the months of May and June. These included the Spill Report numbers 16-158, 16-176, 16-181, 16-198, 116-202, and 116-202 Update No. 1. Copies of the original Spill Reports are provided in Appendix A. During the current reporting period, there were no further unauthorized sediment releases reported.

As of September 2nd, the potentially affected drainages continue to run, for the most part, visually clear of sediment. There were natural slope sloughing events upstream of the project development area and downstream of Deposit 1 on the MMER tributary during the reporting period which resulted in intermittent increased sediment loading in Mary River. Minor Rain events also contributed to sediment loading during this reporting period in Mary River. Monitoring results for late August are included in this report.

Retention of Third Party Expertise

When sediment release events were first observed and reported, third party expertise was retained and these individuals were brought to site. A list of those individuals and support provided was detailed in the June 24th, 2016, Report on Actions Taken. We continue discussions with those various individuals to provide advice as warranted. During the reporting period, the following consultants/contractors provided assistance:

- In early August, Golder was selected as the key consultant to support Baffinland in the development of the Dust Mitigation Action Plan and the Tote Road and Mine Haul Road Mitigation Action Plans. Action and mitigation plans continued to be developed during this reporting period.
- In late August, Nuna was contracted to complete select environmental work for Baffinland. This work included the maintenance and clearing of sediment from the ditching system and sumps before culverts on the Mine Haul road. This work is currently ongoing.

2. Water Quality and Acute Toxicity Sampling Results for Areas of Concern

Spill Reports for sediment releases are provided in Appendix A. Potential receivers for the sediment releases included Sheardown Lake, Sheardown Lake Tributary, Camp Lake, Camp Lake Tributaries, Mary River and Mary River Tributaries, David Lake and David Lake Tributaries, Muriel Lake and Muriel Lake Tributaries.

Available water quality and acute toxicity results for Sheardown Lake, Camp Lake, and Mary River systems are provided in Appendix B. These results include data provided in the previous reports covering the period up to August 30th, 2016, as well as new results that became available during the current reporting period. GPS coordinates and maps are provided to show approximate sample locations as well as the location of structures that were installed to mitigate the sediment concerns.

Water quality results have been compared to the Effluent Quality Discharge Limits for Contact Water (Table 11) provided in the Type "A" Water Licence No. 2AM-MRY1325 for the Mary River Project, which are summarized in the table below:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	15	30
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Note that in areas where there is or has been active construction, the following effluent discharge limits apply:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	50	100
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

During the current August 20^{th} to September 2^{nd} reporting period, there were a number of water samples on Mary River that exceeded the Maximum Average Concentration of our Type A Water licence on Mary River. An investigation of the source of the sediment indicated that slope sloughing up stream of the project development area primarily contributed to this sediment loading, however low volumes of turbid water from the MMER tributary contributed intermittently to the increased sediment loading in Mary River. Freeze, thaw conditions and minor rain events predominantly caused the sloughing observed.

The Mary River sloughing was approximately 10km upstream of the project development area. Additional sampling was completed at G0-03 to evaluate sediment loading upstream of mine related effects.

The sloughing present above the low flow MMER tributary is approximately 1km upstream of F0-01. Silt fencing was installed on August 27 to reduce the levels of sediment being discharged at F0-01.

Due to the historically non-lethal water quality results over the reporting period for the areas of concern, further acute toxicity analyses was not performed. Previous acute toxicity analyses have shown non-lethal results from the discharge water samples that were collected and reported previously.

Water sampling will continue on a periodic basis, and additional data, including laboratory results that are in progress for this reporting period, will be included in future bi-weekly update reports. To monitor the increased sediment loading in Mary River, primarily resultant from the slope sloughing above the project development area, increased monitoring was performed during this reporting period.

3. Corrective Measures for Reported Spills and Other Concerns

3.1. Immediate actions undertaken to address issues

A number of immediate actions were undertaken to address sediment releases to water bodies that were documented in the Spill Reports submitted to authorities. These actions were presented in previous Reports on Actions Taken.

In the case of the Milne Ore Pad and the Mine Site Ore Pad drainage and collection systems, construction of ditch systems were completed by June 15 and July 15, respectively. As of those dates, the ditching systems were functional and currently performance is under observation and evaluation. Construction

Summary Reports (CSRs) for the facilities are currently in preparation and will be submitted to the Nunavut Water Board within three months after the substantial completion of construction.

3.2. Detailed work completed by area of concern

Any new work actions taken during the August 20 to September 2 reporting period for the areas of concern are provided in Appendix C. Actions taken are appended to the overall action list provided in the previous work action lists. In addition, new photos for the current reporting period are provided as warranted. Appendix C is subdivided as follows:

Appendix C.1: Spill Report 16-158 - Sheardown Lake Tributaries and Sheardown Lake.
Appendix C.2: Spill Report 16-176 - Camp Lake Tributaries and Camp Lake.
Appendix C.3: Spill Report 16-181- Mine Haul Road to Mary River and Sheardown Lake Tributary.
Appendix C.4: Spill Report 16-198 - Camp Lake Tributary 1
Appendix C.5: Spill Report 16-202 and Update No. 1 - Milne Inlet Tote Road, Tributaries to Mary Lake, David Lake, and Muriel Lake.
Appendix C.6: Milne Port Ore Stockpile Drainage Collection System.
Appendix C.7: Milne Port Beach
Appendix C.8: Sediment on and under bridges along Tote Road.

4. Next Steps

4.1. Bi-weekly update reports

Bi-weekly update reports will continue to be provided including any additional construction work completed and additional water sampling data. The next report will cover the period from September 2nd to September 16th, 2016.

4.2. Completed construction repairs

Construction repairs for the areas of concern including the Milne Port Ore Stockpile Drainage system and the Mine Site Crusher Stockpile Pad have been substantially completed by the established July 17, 2016, deadline.

4.3. Lessons-learned

Baffinland will conduct an extensive review and analyses of lessons- learned with regard to sedimentation issues along the roads and at the camps. Key conclusions and recommendations will be provided in the Completion Report which will be provided to regulators and inspectors. Baffinland will be open to any comments and recommendations received and will make revisions as is appropriate.

4.4. Long-term action plans

Longer term action plans related to dust mitigation and Tote Road work as related to drainage considerations are underway and will be provided by September 30, 2016.

4.5. Completion Report

A completion report that summarizes the results of all work to date and is signed off by the CEO of the company will be provided by September 30, 2016.

Report Basis

The document provided, herein, is the sixth bi-weekly progress report as required under the June 7 Fisheries Direction provided by Environment Canada (page 6, Measures to be Taken, Item 1) and reports on the period September 2nd through September 16th. Specifically, the bi-weekly reports are to provide updates on the actions taken to address sedimentation issues and ongoing actions being taken at the site to address Items 2 and 3 as outlined in the Fisheries Direction. Previous actions, including pre-freshet actions, were reported on in the June 24th, 2016, Report on Actions Taken and subsequent Bi-Weekly Reports Nos. 1 to 5, incl.

1. Unauthorized Releases and Contributing Factors

A number of unauthorized releases of sediment were reported to Environment Canada (EC), Indigenous and Northern Affairs Canada (INAC), and the NT-NU Spill Line during the months of May and June. These included the Spill Report numbers 16-158, 16-176, 16-181, 16-198, 116-202, and 116-202 Update No. 1. Copies of the original Spill Reports are provided in Appendix A. During the current reporting period, there were no further unauthorized sediment releases reported.

During the reporting period, the monitored streams and tributaries continued to run visually clear of sediment. Near the end of this reporting period, sub-zero temperatures have resulted in the freeze up of many of the monitored streams.

Retention of Third Party Expertise

When sediment release events were first observed and reported, third party expertise was retained and these individuals were brought to site. A list of those individuals and support provided was detailed in the June 24th, 2016, Report on Actions Taken. We continue discussions with those various individuals to provide advice as warranted. During the reporting period, the following consultants/contractors provided assistance:

- In early August, Golder was selected as the key consultant to support Baffinland in the development of the Dust Mitigation Action Plan and the Tote Road and Mine Haul Road Mitigation Action Plans. Action and mitigation plans continued to be developed during this reporting period.
- In late August and early September, Nuna Logistics was contracted to complete select environmental work for Baffinland. This work included the maintenance and clearing of sediment from the ditching system and sumps upstream of culverts and check dams adjacent to the Mine Haul road. The planned work was completed.

2. Water Quality and Acute Toxicity Sampling Results for Areas of Concern

Spill Reports for sediment releases are provided in Appendix A. Potential receivers for the sediment releases included Sheardown Lake, Sheardown Lake Tributary, Camp Lake, Camp Lake Tributaries, Mary River and Mary River Tributaries, David Lake and David Lake Tributaries, Muriel Lake and Muriel Lake Tributaries.

Available water quality and acute toxicity results for Sheardown Lake, Camp Lake, and Mary River systems are provided in Appendix B. These results include data provided in the previous reports covering the period up to September 5th, 2016, as well as new results that became available during the current reporting period. GPS coordinates and maps are provided to show approximate sample locations as well as the location of structures that were installed to mitigate the sediment concerns.

Water quality results have been compared to the Effluent Quality Discharge Limits for Contact Water (Table 11) provided in the Type "A" Water Licence No. 2AM-MRY1325 for the Mary River Project, which are summarized in the table below:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	15	30
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

Note that in areas where there is or has been active construction, the following effluent discharge limits apply:

Parameter	Maximum Average Concentration (mg/L)	Maximum Concentration of any Grab Sample (mg/L)
Total Suspended Solids (TSS)	50	100
Oil and Grease	No Visible Sheen	No Visible Sheen
pH	Between 6.0 and 9.5	Between 6.0 and 9.5

During the current September 2nd to September 16th reporting period, low flows at LDFG-OUT resulted in sediment being stirred up during sampling on September 5th, resulting in a TSS of 22 mg/L. Continued low flows and freeze-up shortly after prevented the resampling of LDFG-OUT. Similarly, low flows, winter storms and freeze-up prevented the collection of water samples at the monitored streams (culverts) along the Tote Road. Due to decreasing sub-zero temperatures and freeze up, periodic water quality monitoring has been discontinued for the year.

All other monitored locations showed no exceedances to the Water Licence criteria listed above during the reporting period.

Due to the historically non-lethal water quality results over the reporting period for the areas of concern, further acute toxicity analyses was not performed. Previous acute toxicity analyses have shown non-lethal results from the discharge water samples that were collected and reported previously.

3. Corrective Measures for Reported Spills and Other Concerns

3.1. Immediate actions undertaken to address issues

A number of immediate actions were undertaken to address sediment releases to water bodies that were documented in the Spill Reports submitted to authorities. These actions were presented in previous Reports on Actions Taken.

In the case of the Milne Ore Pad and the Mine Site Ore Pad drainage and collection systems, construction of ditch systems were completed by June 15 and July 15, respectively. As of those dates, the ditching systems were functional and currently performance is under observation and evaluation. Construction Summary Reports (CSRs) for the facilities are currently in preparation and will be submitted to the Nunavut Water Board within three months after the substantial completion of construction.

3.2. Detailed work completed by area of concern

Any new work actions taken during the September 2nd – 16th reporting period for the areas of concern are provided in Appendix C. Actions taken are appended to the overall action list provided in the previous work action lists. In addition, new photos for the current reporting period are provided as warranted. Appendix C is subdivided as follows:

Appendix C.1: Spill Report 16-158 - Sheardown Lake Tributaries and Sheardown Lake.
Appendix C.2: Spill Report 16-176 - Camp Lake Tributaries and Camp Lake.
Appendix C.3: Spill Report 16-181- Mine Haul Road to Mary River and Sheardown Lake Tributary.
Appendix C.4: Spill Report 16-198 - Camp Lake Tributary 1
Appendix C.5: Spill Report 16-202 and Update No. 1 - Milne Inlet Tote Road, Tributaries to Mary Lake, David Lake, and Muriel Lake.
Appendix C.6: Milne Port Ore Stockpile Drainage Collection System.
Appendix C.7: Impacted Snow Removal from Milne Beach and Tote Road Bridges

4. Next Steps

4.1. Bi-weekly update reports

This will be the last biweekly update report (No. 6) before the completion report is submitted by September 30, 2016.

4.2. Completed construction repairs

Construction repairs for the areas of concern including the Milne Port Ore Stockpile Drainage system and the Mine Site Crusher Stockpile Pad have been substantially completed by the established July 17, 2016, deadline.

4.3. Lessons-learned

Baffinland will conduct an extensive review and analyses of lessons- learned with regard to sedimentation issues along the roads and at the camps. Key conclusions and recommendations will be provided in the Completion Report which will be provided to regulators and inspectors. Baffinland will be open to any comments and recommendations received and will make revisions as is appropriate.

4.4. Long-term action plans

Longer term action plans related to dust mitigation and Tote Road work as related to drainage considerations are underway and will be provided by September 30, 2016.

4.5. Completion Report

A completion report that summarizes the results of all work to date and is signed off by the CEO of the company will be provided by September 30, 2016.

COMPLETION REPORT (ABBREVIATED)

Completion Report:

Environment and Climate Change Canada Fisheries Act Direction (File: 4408-2016-05-10-001) and

INAC Letter of Non-Compliance

(NWB Licence 2AM-MRY1325)

September 2016

DATE	REV	STATUS	PREPARED BY	APPROVED BY
29 Sept 2016	0	Issued For Use	Wayne McPhee	Brian Penney

This Completion Report has been prepared by Baffinland Iron Mines Corporation (Baffinland) to respond to the *Fisheries Act* Direction (FAD) received from Environment and Climate Change Canada (ECCC) and the Letter of Non-Compliance (LNC) received from Indigenous and Northern Affairs Canada (INAC) on June 7, 2017 and June 16, 2017, respectively. The FAD and LNC were based on inspections made of the Mary River Project Site by ECCC and INAC Enforcement and Water Resource Officers during the period May 18 to 20, 2016. Specifically, this report complies with a requirement in those documents for a submission of a Completion Report by September 30, 2016.

Unauthorized Sediment Releases

Freshet in 2016 was characterized by high flows in the tributaries and streams due to a thick snow pack, large snow drifts from blowing snow and an early start to Freshet. During the early stages of freshet, there were a number of instances where water samples exceeded the Discharge Criteria for Total Suspended Solids (TSS) but as the incident response measures were implemented, the majority of the discharge samples met the discharge criteria. In addition, all samples collected for Acute Toxicity analysis have shown non-lethal results from the discharge.

Unauthorized releases of sediment were reported by Baffinland to ECCC, INAC, and the NT-NU Spill Line during the months of May and June 2016. These included the Spill Report numbers 16-158, 16-176, 16-181, 16-198, 116-202, and 116-202 Update No. 1.

ECCC Fisheries Act Direction (FAD) and INAC Letter of Non-Compliance (LNC)

The FAD and LNC documents specified measures to be taken by Baffinland to reduce the risk of ongoing and future sedimentation and to also take action to improve current conditions (e.g., completion of some construction ditching projects).

ECCC FAD Measures to be taken

"Immediately take all reasonable measures consistent with public safety and with the conservation and protection of fish and fish habitat to prevent the above mentioned occurrence or to counteract, mitigate, or remedy, any adverse effects that result from the above mentioned occurrence or might reasonably be expected to result from it, including:

a. Provide by June 24, 2016, a report on the actions taken to address sedimentation issues at the BIM, Mary River Project following the ECCC on-site inspection of May 18-20, 2016 and provide Bi-weekly updates (once every two weeks) of ongoing actions being taken at the site including actions to address issues mentioned in measures to be taken 2 & 3.

b. Provide by September 30, 2016 a dust mitigation action plan with an implementation schedule addressing crushing operations, wind coming in contact with the crushed rock/iron stock piles, and vehicle traffic on the Tote Road.

c. Provide by September 30, 2016 a Tote Road and Mine Hall Road mitigation action plan with an implementation schedule addressing sediment water runoff from the road into culverts, ditches, and creeks/streams which leads to David Lake, Mural Lake, Kabikok Lake, KM 32 Lake and KM27 Lake, Camp Lake, Sheardown Lake, Mary River, and Phillips Creek.

d. *Finish constructing by July 17, 2016 the drainage ditching to the Milne Port Stockpile East Sedimentation Pond (MP05) to allow contact water with the iron ore stockpiles to divert into the Milne Port Stockpile East Sedimentation Pond (MP05) to prevent the contact water from entering Milne Inlet, Arctic Ocean.*

e. *Finish constructing by July 17, 2016 the drainage ditching to the Mary Rive Mine Site Iron Ore Stockpile crusher sediment pond (MS06) to allow contact water with the iron ore stockpiles and crusher area to divert into this Sedimentation Pond (MS06) to prevent the contact water from entering Sheardown Lake.*

A report on the completion of these measures signed by Mr. Brian Penney must be submitted in writing to the undersigned Inspector on or before September 30, 2016."

INAC LNC Measures to be taken

a. Implement a plan to address "*the Ore Stockpile Diversion Ditches at Milne Inlet with a completion date by July 17, 2016*". (Based on May 23, 2016, Plan submitted to INAC)

b. Produce an "*Action Plan to address the sedimentation of watercourses along the Tote Road. This plan shall be submitted to the INAC Inspector by June 24, 2016 and will include a schedule of work to be done in 2016 on the Tote Road to specifically deal with the sedimentation of watercourses.*"

c. Requirement for Baffinland to take reasonable diligence towards meeting the requirement of their licence, Part D Item 4, namely "*The Licensee shall implement sediment and erosion control measures, as required, prior to ensuring all phases of the Mary River Project to prevent and/or minimize sediment loading into water.*"

Preventative and Corrective Actions

Baffinland had undertaken significant measures prior to the May 2016 inspections to prepare for the onset of freshet including but not limited to:

- A major program of culvert replacement and riprap installation was completed on the Mine Haul Road between April 15 and May 15, 2016. The work involved the installation of 525 m of new culverts and the installation of 4,400 m3 of rip rap in 3.5 km of ditches and on surface slopes located upstream and downstream of seven culvert crossings. The as built report for this work is presented in Appendix A.1.
- Clearing of snow from the road surface, embankment, and from areas adjacent to the road to minimize the impact of runoff from road contact water to downstream water bodies.
- Early excavation and clearing of snow from the inlets and outlets of the stream crossings and clearing of culverts with steamers to ensure water flow.
- The installation of silt fences and check dams at selected locations.

Immediate response to the early onset of freshet to address sediment releases to water bodies included:

- Additional silt fence and silt curtain installation.
- Check dam construction and operation to allow settling of solids from the water column.
- Construction of temporary settling ponds near the Camp Lake Jetty.
- Redirection of sediment / turbid waters away from fish habitat using ditches, swales, and pumping.
- Removal of sediment accumulated at culvert crossings at various locations.
- Removal of dirty snow and ice from under Tote Road bridges and from the north end of the Ore Stockpile Area along the beach at Milne Port.

Over the summer months other preventative actions were undertaken including:

- Additional check dam construction (a total of eight).
- Placement of geotextile and riprapping of ditches along the Tote Road and along the upper sections of the Mine Haul Road.
- Targeted road resurfacing with granular material the Tote Road and Mine Haul Road.
- Berm construction along the Tote Road and Mine Haul Road to limit migration of material mobilized due to permafrost degradation.
- Excavation of ditches around the Crusher Stockpile and Ore Stockpile pads to help direct drainage to the established settling ponds.

A comprehensive record of immediate and near term actions undertaken to address sediment releases was provided in update reports to ECCC and INAC including the June 24, 2016 Report on Actions Taken and the six additional Biweekly Progress Reports.

The Ore Milne Ore Stockpile ditching was completed by Baffinland as soon as ground temperatures permitted excavation. A construction plan was submitted to INAC and ECCC inspectors in late May with ditch construction commencing within one week of the May 18 to 20 Regulatory Inspection. The ditching system was substantially completed by mid-June. The as-built drawings for the facility are presented in Attachment A.2.

The ditching system for the Crusher Stockpile area was partially completed in 2015 to allow for drainage from much of the stockpile area to the settling pond. During late June and early July, additional ditching was constructed to fully address drainage from the stockpile area. The as-built drawing for the ditching system constructed this past summer is presented in Attachment A.3.

Dust and Sedimentation Mitigation Action Plans

In response to ECCC direction, comprehensive Dust Mitigation and Sedimentation Action Plans were developed as separate deliverables consistent with the FAD and LNC requirements. These plans are closely related to each other and are synergistic when they are implemented together. Plan development included review of existing information, a site visit by technical specialists in mid-August, interviews with key managers and superintendents on site, and a series of several follow-up meetings and discussions with key representatives of Site Operations.

Dust Mitigation Action Plan

The Dust Mitigation Action Plan (Attachment B) outlines detailed recommended actions including responsible party and schedule for completion for the affected areas of the Project Site. Baffinland commits to completing the recommended actions to address dust management at the Mary River site.

Sedimentation Mitigation Action Plan

The Sedimentation Action Plan (Attachment C) outlines actions including responsible party and schedule for completion for the affected areas of the Project Site. Baffinland commits to completing the recommended actions to address sediment mitigation at the Mary River site.

Lessons Learned

Baffinland has conducted a review and analyses of lessons-learned with regard to sedimentation issues along the roads and at the camps. Key conclusions and recommendations have been provided as part of the Dust and Sediment Mitigation Action Plan reports.

Closure

With the submission of this Completion Report, the report on actions taken to address sedimentation issues (June 24, 2016), Bi-weekly reports, Dust Mitigation Action Plan (Sept 30, 2016), Sedimentation Mitigation Action Plan (Sept 30, 2016), and the completion of construction of drainage structures at Milne Stock pile (Sept 27, 2016), and Mary River Site Iron Ore Stockpile (Sept 30, 2016), Baffinland has complied with the requirements of the ECCC *Fisheries Act* Direction and INAC Letter of Non-Compliance.

TABLES

1.0 INTRODUCTION

On May 10, 2016, Mr. James Millard, Baffinland Iron Mines (Baffinland) Environmental Manager provided an email report to Mr. Curtis Didham, an Inspector designated by the Minister of Fisheries and Oceans (EO Didham), that on May 7, 2010, a snowmelt event occurred at the Baffinland site that led to sediment-laden runoff flowing into Sheardown Lake. Further, on May 17, 2016, Mr. Allan Knight, Baffinland Environmental Superintendent reported to Northern District Spills Duty Officer, EO MacDonald that a snowmelt event resulted in runoff containing sediments was observed to be flowing into Camp Lake Tributary #1 and into Camp Lake. EO MacDonald forwarded the report to EO Didham. These events, singularly and collectively set in motion a process of sample collection, laboratory analysis, reporting and ultimately resulted in a Baffinland site visit and inspection by EO Didham, Indigenous and Northern Affairs Canada (INAC) Water Resource Officers Justin Hack and Jonathan Mesher and INAC Environmental Assessment Officer Jason Patchell on May 18th and 19th, 2016.

A number or outcomes resulted from the site visit and inspection of the Baffinland site including a *Fisheries Act Direction* (FAD) to remedy a number of the immediate issues and further to develop and implement two action plans including, and by September 30, 2016:

1) A Dust Mitigation Action Plan with an implementation schedule addressing crushing operations, wind coming in contact with the crushed rock/iron stockpiles and vehicle traffic on the Tote Road; and
2) A Tote Road and Mine Haul Road Mitigation Action Plan with an implementation schedule addressing sediment water runoff from the road in to culverts, ditches and creeks/streams which lead to David, Mural, Kabikok, KM 32, KM 27, Camp and Sheardown lakes and into the Mary River and Phillips Creek.

The action plans were developed to address the specific areas noted in the FAD and to also address other areas on the site where dust and sediment could become an issue in the future. The action plans have been developed as separate deliverables consistent with the direction, but it is important to recognize that they are closely related to each other and will be synergistic when they are implemented together. This document specifically addresses the *Dust Mitigation Action Plan*.

Baffinland retained Golder Associates Ltd. (Golder) to prepare both the Dust Mitigation Action Plan and the Sedimentation Action Plan. The preparation of these plans included a site visit by Messrs. Chris Madland, Senior Air Quality Scientist, and Paul Bedell, PEng, Senior Geotechnical Engineer, of Golder from August 12 to August 16, 2016, inclusive. Extensive discussions between Baffinland personnel and Golder were carried out to develop the plans.

The Reader is referred to the Study Limitations (Section 8.0), which follows the text and forms an integral part of this document.

2.0 TOTE ROAD

Dust generated from use of the Tote Road is one of the items identified in the FAD that requires attention. The Tote Road is currently being used in this early phase of the Baffinland project to transport crushed ore from the crusher site at the main mine complex to the Milne Port Site. The Tote Road is a 100 kilometre (km)-long gravel road that supports approximately 100 return haul truck trips per day.

2.1 What are the mechanisms for dust generation on the Tote Road?

There are three mechanisms involved in generating dust along the Tote Road. Each of these mechanisms could result in dust being transported from the road to the immediately adjacent land and potentially into nearby water bodies. The three different ways that dust generation has been observed include:

- Wheel Entrainment;
- Wind-blown Dust; and
- Losses from the Ore Haul Truck Boxes.

2.1.1 Wheel Entrainment

Wheel-entrained dust is the dust that is re-suspended into the air after the passage of a vehicle on the road surface. It is suspended due to direct mechanical contact with vehicle tires and the following turbulent air at the surface and in the wake of the vehicle further lofts the particles where they are subject to any ambient wind present. This type of dust is typically composed of relatively large particles (most particles >30 microns (µm)) that fall out of suspension within a short distance of the road, e.g., within approximately 100 metres of the road, most of the dust will be settled out of the air column. The calculated amount of dust that is suspended due to wheel entrainment on an unmitigated gravel road that is typically generated by vehicle passage is described in the United States Compendium of emission factors (AP-42) is affected considerably by two factors. The two factors include the silt content (particles nominally smaller than 75 µm) of the travel surface and the weight of the vehicle using the road. In general terms, the higher the silt content and the heavier the vehicle, the more dust generation should be expected.

During a Golder Associates (Golder) site reconnaissance and inspection visit completed in mid-August, a step in the development of this Action Plan, we observed that among the various sources of dust present at the Mine, the crusher, the Port and along the Tote and Mine Haul roads, wheel-entrained dust was the single most significant and important source. The relatively short time to complete the action plan has not permitted the development of an objective measurement program to definitively quantify dust from each of the sources, nor is such a program actually necessary. Many years of experience in addressing dust management issues in the Arctic, Sub-Arctic and many other locations around the world provide an appropriate lens through which the dust issues at Baffinland can be viewed and addressed.

Though wheel-entrained dust is considered the most important source of dust on the site in general, Golder notes that between dust generation and erosion issues related to moving water on and near the road, airborne dust deposition is the least likely to lead to inappropriate levels of total suspended solids in the areas' water bodies.

2.1.2 Wind-blown Dust

Wind-blown dust on the Tote Road is also recognized as a source of dust. The following (in italics) is an excerpt from the United States Environmental Protection Agency (U.S. EPA). It is part of the introductory section of the Fugitive Dust Sources Chapter (13.2):

> *Significant atmospheric dust arises from the mechanical disturbance of granular material exposed to the air. Dust generated from these open sources is termed "fugitive" because it is not discharged to the atmosphere in a confined flow stream. Common sources of fugitive dust include unpaved roads, agricultural tilling operations, aggregate storage piles, and heavy construction operations.*

In general terms, wind-blown dust could be expected when dry conditions, fine materials (particles <75 µm) on the road surface and relatively strong winds (over 19 km/hr) prevail. If any of these three factors are not present, wind-blown dust should be considered a negligible source.

While on site for the reconnaissance visit in mid-August, which was largely characterized by dry, windy conditions, we did observe the presence of wind-blown dust along the Tote Road. While these conditions were occasionally present during our visit, our observations during the multi-day visit and complete travel of the Tote Road suggest that wind-blown dust is a small source, especially when compared to the dust generated through wheel entrainment. Given our assertion that even wheel-entrained dust should be considered a minor contributor to sediment loading in local water bodies, the importance of wind-blown dust in the overall management of in-stream sedimentation is low.

2.1.3 Losses from the Ore Haul Truck Boxes

Ore is loaded into open-topped side-dump style haul trucks for transport along the Tote road from the crusher area at the mine site to the Milne port. There is some potential that iron ore dust, when exposed to the wind could be caught by the wind and be blown out of the truck box. During a site visit in mid-August, it was apparent, even through visual observation, that this potential source is not an important contributor to dust. The iron ore has a high density and is not easily moved by wind. No dust was observed to be leaving the trucks as they moved along the Tote Road.

2.2 What actions have been undertaken to date to address each of the identified sources?

Baffinland has undertaken a number of actions over the course of the summer season to control dust emissions related to travel along the haul road. They include the following:

- Road Resurfacing;
- Application of Chemical Suppressant; and
- Application of Water.

2.2.1 Wheel Entrainment

The single most substantial reduction in the amount of dust produced that has been achieved to date related to wheel entrainment has been the application of chemical dust suppressant (CaCl), followed by grading and water application to the Tote Road running surface. Our observations suggest that when an appropriate running surface is adequately treated and maintained, that dust generation was considerably reduced. Though a specific measurement program was not conducted to support this claim, it is widely known in the dust management industry that reductions of 80% are readily achievable using this treatment regime. In the areas of the Tote Road where chemical suppressants and watering were employed, they were effective and we suggest that an 80% reduction in dust generation was achieved.

Progress was made in the spring and summer of 2016 on resurfacing portions of the Tote Road. Note that the limited re-topping of the Tote Road running surface that has been completed to date has not, nor would it be expected to be effective in controlling dust emissions on its own. For re-topping alone to be effective, the material would need to be unduly coarse, and would lead to haul-truck maintenance issues.

2.2.2 Wind-blown Dust

The same activities that led to meaningful reductions in dust generation on areas of the Tote Road related to wheel entrainment were also effective in controlling wind-blown dust from the surface of the road. The combination of a structurally sound road embankment and running surface coupled with the integration of chemical suppressants and watering have been effective in the areas where the application has been substantially completed. The road maintenance team was observed to be actively engaged in dust suppression activities at various locations along the Tote Road.

2.2.3 Losses from the Ore Haul Truck Boxes

As described in Section 2.1.3, losses from the ore haul truck boxes play a very minor, even negligible role in dust management at Baffinland and an even less significant role in the contribution of sediment to waterbodies in the vicinity of the Tote Road. No specific action has been taken to limit dust transport from the boxes of the ore haul trucks.

2.3 What additional actions will be undertaken to address each of the identified dust sources?

2.3.1 Wheel Entrainment

Section 2.2.1 of this action plan discussed in some detail the actions that have been undertaken to date to limit the amount of dust released from the Tote Road surface as a function of wheel entrainment. The continuation of the three identified activities is recommended including road resurfacing with durable, coarse, granular fills, the application and integration of chemical dust suppressants (CaCl) and road watering. The coordination of these activities should be directed through the Tote Road management plan which will be updated over the winter of 2016/17 and will be in place prior to the 2017 "dust season." The dust season refers to the period nominally between June and October where it is reasonable to expect that the Tote Road surface would be bare. A compacted snow veneer on the Tote Road is expected to reduce dust emissions by approximately 95% between November and May.

Progress was made in the spring and summer of 2016 on resurfacing portions of the Tote Road. Because the season for road improvements has largely passed for 2016, the resurfacing activities will need to resume after the break-up season in 2017, after the frost has left the active layer and the road embankment has dried to the point where it can be improved with blading and supplemental materials without doing damage in the process. The length of the Tote Road should be brought up to a specification that includes a minimum of 150 mm depth of coarse granular fill over several years and will require regular maintenance over time to maintain the running surface and manage dust.

The application of a durable and workable running surface will not appreciably reduce dust generation without the integration of chemical suppressants and regular maintenance through road watering. The August 2016 sea-lift brought an additional 20 sea containers of CaCl to the site for use on the Tote Road and other high priority areas. CaCl should be applied using the existing tandem-axel spreader truck in the dust season as needed until the compacted snow veneer is established on the road.

CaCl suppressant works primarily by retaining existing soil moisture at the surface and promoting the “cementing” and retention of fine materials in the road surface. From time to time however, the road embankment and surface will dry to the point where the presence of CaCl alone will not materially affect dust generation. Supplemental watering of the Tote Road is recommended through the use of the existing “740 water truck”, and the existing, smaller, tandem water truck in the dust season. The existing tandem water truck should be retrofitted to improve the efficiency of distribution of water through an appropriate spreader-bar and pump. The tandem water truck should also be fitted with a filling fixture so that it can be filled with a six-inch pump to reduce filling times. Additional water truck capacity should be added to the Tote Road water truck fleet. The retrofits and increased watering capacity are expected to considerably increase the efficiency of watering on the Tote Road.

2.3.2 Wind-blown Dust

The actions proposed to manage wind-blown dust are the same as those prescribed to manage wheel-entrained dust. No additional actions are required or proposed beyond those being taken to limit wheel-entrained dust. Wind-blown dust is considered a minor source relative to the wheel-entrained dust.

2.3.3 Losses from the Ore Haul Truck Boxes

Observations made during a site visit in mid-August suggest that the amount material being deposited on and adjacent to the Tote Road related to ore dust being blown out of the truck boxes is negligible. No additional actions are proposed to limit the very small potential for deposition to water bodies adjacent to the Tote Road from this dust source.

Table 2-1 summarizes the dust mitigations actions planned for the Tote Road.

Table 2-1 Tote Road Dust Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Chemical suppressant (CaCl) application	Ore Handling	Summer months every year
Road watering equipment retrofit and supplement	Ore Handling	Retrofit completed by May 31, 2017, supplemental equipment to arrive on 2017 sea-lift
Road watering	Ore Handling	Summer months every year

3.0 CRUSHER PAD

Dust generated from use of the crusher pad is one of the items identified in the FAD that requires attention. The crusher pad is located at the mine site at the bottom end of the mine haul road. The equipment on it is used to process raw ore that has been transported from the mine into pieces nominally 30 mm in diameter (lump ore) and 19 mm in diameter (fines), to stock pile it temporarily and then to load it into the haul trucks for transport on the Tote Road to the Milne Port. The crushing facilities on the pad are also used to crush granitic materials to produce aggregate for various purposes at the mine including road building.

3.1 What are the mechanisms for dust generation on the crusher pad?

There are several important sources of dust generation on the crusher pad. Some are similar to those already discussed in Section 2 of the Action Plan relating to the Tote Road and others are related specifically to the processing of iron ore and aggregate. The important sources include the following:

- Wheel Entrainment;
  - Haul truck
  - Front-end loader
- Wind-blown Dust;
- Conveyor Transfer Points;
- Ore Discharge to Surge Pile;

3.1.1 Wheel Entrainment

The mechanism whereby wheel-entrained dust is generated is discussed in detail in Section 2.1.1. It is considered the most important source of dust on the site in general and in the case of the crusher pad, wheel-entrained dust sources include the movement of front-end loaders used for managing the stockpiles and for loading haul trucks, and the movement of the haul trucks on the crusher pad. We note that between dust generation and erosion issues related to moving water on and near the pad, airborne dust deposition is the least likely to lead to inappropriate levels of total suspended solids in the areas' water bodies.

3.1.2 Wind-blown Dust

Wind-blown dust on the crusher pad is also recognized as a source of dust. The mechanism that drives wind-blown dust is discussed in detail in Section 2.1.2. While on site for the reconnaissance visit in mid-August, which was largely characterized by dry, windy conditions, we did observe the presence of a small amount of wind-blown dust at the crusher pad. While these conditions were occasionally present during our visit, our observations during the multi-day visit and ongoing observations suggest that wind-blown dust is a small source, especially when compared to the dust generated through wheel entrainment. Given our assertion that even wheel-entrained dust should be considered a minor contributor to sediment loading in local water bodies, the importance of wind-blown dust in the overall management of in-stream sedimentation is low.

3.1.3 Conveyor Transfer Points

Each of the conveyor transfer points in the crushing circuit and the crushing and screening activities themselves are categorized here generally as conveyor transfer points. The mechanism for dust generation at these locations is similar in each case and regardless of the specific activity, the control effort will take a similar form. As the materials being crushed make their way through the crushing circuits, fines are generated through friction due to abrasion with other aggregate materials being processed and through direct interaction with the hard surfaces of the equipment. In some cases, the fines are retained in the flow of materials and do not become airborne. In other cases, for example where one conveyor discharges to another, materials are dropped a short distance and can become exposed to the prevailing ambient wind of the day. In another example, where materials are separated by size on a screen deck, they can become temporarily suspended in the air. In both these examples, dust can be lost to the wind and transported a short distance from the crusher pad or simply onto the crusher pad itself without leaving the immediate area.

3.1.4 Ore Discharge to Surge Pile

The dust generation associated with the discharge of fine ore to its dedicated surge pile is of particular note. Of the sources not related directly to wheel entrainment on the crusher pad, this source was the most important. During some periods, fine ore and its higher percentage of fines drops a few metres to the surge pile. Under windy conditions, a visible plume of dust was observed being entrained by the wind as the materials cascaded to the surge pile. This is a more important source than much of the rest of the activity in the crushing circuit because the length of time of exposure to ambient wind is considerably greater at this location than at other points in the circuit. It is important to note that wheel entrainment is a more important source by a wide margin.

3.2 What actions have been undertaken to date to address each of the identified dust sources?

In some cases, it was possible to mitigate dust sources on the crusher pad immediately after they were noted during the reconnaissance and inspection visit.

3.2.1 Wheel Entrainment

Upon becoming aware that wheel-entrained dust on the crusher pad was a potentially significant dust source, immediate mitigation action was taken to provide road watering trucks to wet the surface of the crusher pad. Chemical suppressants were not used, nor are they planned for the crusher pad location as they can impact iron ore product quality. The mitigating effects observed due to watering were significant.

3.2.2 Wind-blown Dust

Because there is a substantial amount of traffic on the crusher pad, mechanical pulverizing of the pad materials can make very fine material available for entrainment by the ambient wind. This was observed in small measure at the crusher pad. The actions taken as described in Section 3.2.1 to control wheel-entrained dust were equally effective, timely and appropriate for controlling wind-blown dust where it was observed, primarily on the road portion of the crusher pad.

3.2.3 Conveyor Transfer Points

No specific actions have yet been taken to limit the dust generated at the conveyor transfer points and from various crushing activities. Preliminary discussion about the actions that could be taken have occurred but in each case, some level of engineering and preparation is required to implement the appropriate mitigation.

3.2.4 Ore Discharge to Surge Pile

No specific actions have yet been taken to limit the dust generated where ore and crushed aggregates are discharged to the various surge piles. Preliminary discussion about the actions that could be taken have occurred but in each case, some level of engineering and preparation is required to implement the appropriate mitigation.

3.3 What additional actions will be undertaken to address each of the identified sources?

As discussed in Section 3.2, actions have already been taken to address dust emissions from the crusher pad location. Additional actions are warranted and planned. This section addresses the recommended actions to address the additional dust mitigation needs at the crusher pad.

3.3.1 Wheel Entrainment

The most appropriate dust mitigation action that can be undertaken at the crusher pad regarding wheel entrainment-related dust at the crusher pad is to maintain a moist surface. When the surface is wet, dust generation is typically controlled by approximately 80%. Dust literature suggests that when theoretical calculations of dust are required for assessment purposes, days where there is measureable precipitation (rain or snow) can be considered non-generating days. Systematic watering of the crusher pad surface can be used during the dust season (typically June-September) until the establishment of a compacted snow veneer.

3.3.2 Wind-blown Dust

As described in Section 3.3.1, watering of the pad surface in the dust season is the most effective way to control dust from the crusher pad related to wheel entrainment. When wheel-entrained dust is controlled, wind generated dust will also necessarily be controlled. No additional actions outside of those used to control wheel-entrained dust are proposed for controlling wind-blown dust.

3.3.3 Conveyor Transfer Points

Section 3.2.3 indicated that some level of planning, engineering and procurement may be required to develop an appropriate dust mitigation approach for the crusher conveyor transfer points and other areas in the crusher circuit where materials are temporarily suspended in the air where they could be subject to ambient wind. The primary method of controlling dust at these locations is to enclose the transfer point to the extent possible to reduce the exposure of suspended materials to the wind. The design of equipment shrouding, where there is potential for suspended fines to be exposed to and entrained by the wind, is underway and the shrouding of the transfer points and other exposed locations in the crusher circuit should be completed by June 1, 2017.

3.3.4 Ore Discharge to Surge Pile

Though considered a relatively minor source compared to wheel entrainment at the crusher pad, the discharge point from the crusher circuit to the surge various surge piles is still a source of dust. The potential use of loading bellows fitted to the point of discharge from the conveyors to the surge piles should be evaluated for possible installation prior to the 2017 dust season.

3.3.5 Aggregate-specific Crushing Operations

Observations by mine personnel suggest that crushing aggregate, not iron ore can lead to higher levels of airborne dust. To specifically control dust associated with crushing aggregate, Baffinland should install a water spray-bar on the aggregate crusher spread or feed pile. Watering in the summer months is expected to considerably mitigate dust generation from this source.

Table 3-1 summarizes the dust mitigations actions planned for the Crusher Pad

Table 3-1 Crusher Pad Dust Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Pad watering	Ore Handling	Summer months every year
Installation of shrouding at crusher circuit transfer points	Crushing	December 31, 2017
Install bellows at stockpile conveyor head(s) – fines head first	Crushing	Winter 2016/2017
Install downwind snow fence to limit dustfall transport - trial basis	Crushing	October 31, 2016
Install spray-bar on aggregate crusher spread or feed pile	Crushing	May 1, 2017

4.0 MILNE PORT ORE STOCKPILES

The Milne Port facility serves as a receiving and temporary storage facility for iron ore being transported from the mine and crushers along the Tote Road, prior to being loaded onto bulk transport ships in the ice-free season. Dust is generated from a number of activities at the Milne Port site including from the following:

- Wheel Entrainment from arriving and departing haul trucks, front-end loaders and other smaller equipment necessary for operating the facility;
- Wind-blown Dust from the storage piles and the traveled areas of the pad; and
- To a lesser extent, losses from ore haul truck boxes.

4.1 What are the mechanisms for dust generation at the Milne Port?

4.1.1 Wheel Entrainment

The mechanism whereby wheel-entrained dust is generated is discussed in detail in Section 2.1.1. It is considered the most important source of dust on the site in general and in the case of the Milne Port Ore Stockpiles, wheel-entrained dust sources include the movement of front-end loaders used for managing the stockpiles and the movement of the haul trucks on the pad.

4.1.2 Wind-blown Dust

Wind-blown dust at the Milne Port is also recognized as a source of dust. The mechanism that drives wind-blown dust is discussed in detail in Section 2.1.2. While on site for the reconnaissance visit in mid-August, which was largely characterized by dry, windy conditions, we did observe the presence of a small amount of wind-blown dust at the Milne Port pad. While these conditions were occasionally present during our visit, our observations during the multi-day visit and ongoing observations suggest that wind-blown dust is a small source, especially when compared to the dust generated through wheel entrainment. Given our assertion that even wheel-entrained dust should be considered a minor contributor to sediment loading in local water bodies, the importance of wind-blown dust in the overall management of in-stream sedimentation is low.

4.1.3 Losses from the Ore Haul Truck Boxes

Losses from the boxes of ore-haul trucks has been described as a potential source of dust deposition in Section 2.1.3. We assert that at the Milne Port site, the potential for iron ore dust to be liberated from the haul truck boxes in any meaningful quantities is exceptionally low. It is described in this section to account for the concern that has been raised on the matter but our opinion is that the contributions to dust deposition from this source are negligible.

4.2 What actions have been undertaken to date to address each of the identified dust sources?

4.2.1 Wheel Entrainment

The most appropriate dust mitigation action that can be undertaken at the Milne Port regarding wheel entrainment-related dust is to maintain a moist surface whenever possible. When the surface is wet, dust generation is typically controlled by approximately 80%. Systematic watering of the Milne Port haul truck route across the pad surface during the dust season is being completed. Chemical suppressants are not used for the crusher pad area because of the potential for contamination of the ore.

4.2.2 Wind-blown Dust

Because of the considerable traffic present at the Milne Port, mechanical pulverizing of the pad materials can make very fine material available for entrainment by the ambient wind. This however, was not observed during a visit to the facility. No specific actions have been undertaken to limit wind-blown dust at the facility that are not part of the inherent design of the facility. Inherent design characteristics include the use of stackers instead of front-end loaders where possible, the use of covered conveyors that are in good repair for transferring iron ore from the stockpiles to the ships and the use of loading bellows by the ship-loaders. Each of these components of the design serve to control the transmission of fine particles from their point of origin to the surrounding environment.

4.2.3 Losses from the Ore Haul Truck Boxes

Iron ore dust being blown out of the ore-haul truck boxes is not a significant source of dust; therefore, no specific action has been taken to limit this source.

4.3 What additional actions will be undertaken to address each of the identified mechanisms?

4.3.1 Wheel Entrainment

The most appropriate dust mitigation action that can be undertaken at the crusher pad regarding wheel entrainment-related dust at the crusher pad is to maintain a moist surface. The systematic watering of the crusher pad surface during the dust season should be continued to maintain dust mitigation.

4.3.2 Wind-blown Dust

As described in Section 4.3.1, watering of the Milne Port pad surface in the dust season is the most effective way to control dust from wheel entrainment. When wheel-entrained dust is controlled, wind generated dust will also necessarily be controlled. No additional actions outside of those used to control wheel-entrained dust are proposed for controlling wind-blown dust.

On occasion, it is expected that despite best efforts, some dust may be moved by the wind off the pad. A snow fence system is proposed to limit the spatial extent of the deposition of dust so that it can be more efficiently managed and removed prior to snow melt. The use of snow fence to minimize dust movement will tested in the immediate vicinity of the crusher pad.

4.3.3 Losses from the Ore Haul Truck Boxes

No additional actions are proposed to control dust losses from the ore haul truck boxes.

Table 4-1 summarizes the dust mitigations actions planned for the Milne Port Ore Stockpiles

Table 4-1 Milne Port Ore Stockpiles Dust Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Pad watering	Ore Handling	Summer months every year
Install downwind snow fence to limit dust fall transport - trial basis	Ore Handling	October 31, 2016

5.0 MINE HAUL ROAD

The mine haul road is a 6 km-long gravel road used to transport raw ore from the mine down the mountain to the crushing facilities where it is processed and loaded for transport along the Tote Road to the Milne Port.

5.1 What are the mechanisms for dust generation on the Mine Haul Road?

There are two important mechanisms involved in generating dust along the mine haul road. Each of these mechanisms could result in dust being transported from the road to the immediately adjacent land and potentially into nearby water bodies. The two ways that dust generation has been observed include:

- Wheel Entrainment; and
- Wind-blown Dust.

5.1.1 Wheel Entrainment

The mechanism whereby wheel-entrained dust is generated is discussed in detail in Section 2.1.1. It is considered the most important source of dust on the site in general and in the case of the mine haul road, primarily includes the movement of haul trucks up and down the mountain and light vehicle traffic. We note that between dust generation and erosion issues related to moving water on and near the mine haul road, airborne dust deposition is the least likely to lead to inappropriate levels of total suspended solids in the areas' water bodies.

5.1.2 Wind-blown Dust

Wind-blown dust on the Tote Road is also recognized as a source of dust. The mechanism that drives wind-blown dust is discussed in detail in Section 2.1.2.

While on site for the reconnaissance visit in mid-August, which was largely characterized by dry, windy conditions, we did observe the presence of wind-blown dust along the mine haul road. While these conditions were occasionally present during our visit, our observations during the multi-day visit and travel of the mine haul road suggest that wind-blown dust is a small source, especially when compared to the dust generated through wheel entrainment.

5.2 What actions have been undertaken to date to address each of the identified sources?

5.2.1 Wheel Entrainment

The single most substantial reduction in the amount of dust produced that has been achieved to date related to wheel entrainment on the mine haul road has been the application of water using a dedicated 740 water truck. Our observations suggest that when an appropriate running surface is adequately treated and maintained, that dust generation was considerably reduced.

5.2.2 Wind-blown Dust

The same activities that led to meaningful reductions in dust generation on areas of the mine haul road related to wheel entrainment were also effective in controlling wind-blown dust from the surface of the road. The application of water has been effective in controlling wheel-entrained dust and in controlling wind-blown dust. The mine road maintenance team was observed to be actively engaged in dust suppression activities on the mine haul road.

5.3 What additional actions will be undertaken to address each of the identified dust sources?

5.3.1 Wheel Entrainment

The activities currently being undertaken at the mine haul road to control dust have been quite effective. Additional gains could be made, however, by spending less time filling the water truck and more time applying water. It was noted during the site visit that the water truck was being filled using a four-inch pump and a fill time of approximately 35 minutes was common. Retrofitting the water truck to accept filling using a six-inch pump will significantly reduce the amount of time the water truck takes to fill and additional operator time can be spent watering the roads instead of waiting for the truck to fill. Retrofitting the water truck to improve efficiency should be implemented prior to the 2017 dust season.

A pilot program to test the effectiveness of the application of chemical suppressants in this setting is proposed for the summer of 2017 as well. Chemical suppressants anticipated for testing include CaCl and EK-35. Other suppressants may be included in the testing program as appropriate.

5.3.2 Wind-blown Dust

The actions proposed to manage wind-blown dust are the same as those prescribed to manage wheel-entrained dust. No additional actions are required or proposed beyond those being taken to limit wheel-entrained dust. Wind-blown dust is considered a minor source relative to the wheel-entrained dust.

Table 5-1 summarizes the dust mitigations actions planned for the Mine Haul Road.

Table 5-1 Mine Haul Road Dust Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Chemical suppressant (CaCl) or EK-35 application (subject to performance of pilot program)	Mine Operations	August 31, 2017
Road watering equipment retrofit and supplement	Mine Operations	Retrofit completed by May 31, 2017
Road watering	Mine Operations	Summer months every year

6.0 MINE AND MILNE PORT SITE

Though the specific areas of the mine are not discussed directly in the FAD, Baffinland considers it important to include them in the general discussion around dust management at the site. Dust generation arising from vehicle use at the various pads, laydowns and parking areas was apparent during a site visit in mid-August and the desired holistic approach to management would not be possible without consideration of these areas.

6.1 What are the mechanisms for dust generation at the Mine and Milne Port Site pads, laydowns and parking areas?

As discussed in detail in each of the sections above, wheel entrainment and wind-blown dust each play an important role in the generation of dust at the Baffinland operation and the mine site pads, laydowns and parking areas are also prone to dust generation from these sources.

6.1.1 Wheel Entrainment

The mechanism whereby wheel-entrained dust is generated is discussed in detail in Section 2.1.1. Wheel-entrained dust is considered the most important source of dust on the site in general and in the case of the mine site pads, laydowns and parking areas, wheel-entrained dust sources primarily include the movement of light traffic and heavy equipment. We note that between dust generation and erosion issues related to moving water on and near the pads, laydowns and parking areas , airborne dust deposition is the least likely to lead to inappropriate levels of total suspended solids in the areas' water bodies.

6.1.2 Wind-blown Dust

Wind-blown dust at the mine site pads, laydowns and parking areas are a recognized as a source of dust. While on site for the reconnaissance visit in mid-August, which was largely characterized by dry, windy conditions, we did observe the presence of wind-blown dust at many of these locations. While these conditions were occasionally present during our visit, our observations during the multi-day visit suggest that wind-blown dust is a small source, especially when compared to the dust generated through wheel entrainment.

6.2 What actions have been undertaken to date to address each of the identified sources?

6.2.1 Wheel Entrainment

Upon becoming aware of the dust issue at the mine site, a plan was developed to have the mine road water truck extend its route to include some of the pads, laydowns and parking areas. When water was applied, considerable reductions in dust generation were noted.

6.2.2 Wind-blown Dust

The same actions taken to reduce dust generation arising from wheel entrainment are applicable to mitigate wind-blown dust.

6.2.3 Airstrip Dust Mitigation

A dedicated dust suppression program using a specialized dust suppressant (EK-35) is being evaluated for the mine site airstrip.

6.3 What additional actions will be undertaken to address each of the identified dust sources?

6.3.1 Wheel Entrainment

The mine haul water truck and the Tote Road water truck will be coordinated and deployed to water the pads, laydowns and parking areas. The evaluation of the EK-35 suppressant program will continue at the airstrip.

6.3.2 Wind-blown Dust

The mine haul water truck and the Tote Road water truck will be coordinated and deployed to water the pads, laydowns and parking areas.

Table 6-1 summarizes the dust mitigations actions planned for the Mine and Milne Port Site.

Table 6-1 Mine and Milne Port Site Dust Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Apply chemical dust suppressant on pads, laydowns, and parking areas (calcium chloride)	Site Services	Summer months every year
Evaluate the use of EK-35 at the airstrip	Site Services	Continue
Apply water as a dust suppressant	Site Services	Summer months every year

7.0 SUMMARY AND CONCLUSIONS

Wheel-entrained road dust is the single most important source of dust to be controlled at the Baffinland site; however, it should be noted, that as it relates to sedimentation in local streams and water bodies, even wheel-entrained dust should be considered a relatively small source in comparison to the erosion potential of water transporting sediments to water bodies.

There is a considerable amount of effort and expense that has gone into the reduction of dust generation at the Baffinland facility over the course of the summer of 2016. In many cases, the efforts have been rewarded with substantial reductions in dust generation. Road resurfacing, the application of chemical suppressants and watering have all played a role in the effort and results to date. More remains to be done, however, to appropriately mitigate dust generation. Depending on the area of the operation in question, this could mean:

- retrofitting equipment to be more efficient (water truck filling or dispensing),
- acquiring additional equipment (additional water truck) or supplies (CaCl, EK-35 or other), or
- adding dust control devices like shrouds and loading bellows at various points in the crushing circuits.

With a coordinated approach to dust management as described in this action plan, significant additional gains can be realized that will contribute to the overall reduction of sediment in local water bodies.

8.0 STUDY LIMITATIONS

Golder Associates Ltd. (Golder) has prepared this document in a manner consistent with that level of care and skill ordinarily exercised by members of the engineering and science professions currently practising under similar conditions in the jurisdiction in which the services are provided, subject to the time limits and physical constraints applicable to this document. No warranty, express or implied, is made.

This document, including all text, data, tables, plans, figures, drawings, and other documents contained herein, has been prepared by Golder for the sole benefit of Baffinland Iron Mines Corporation (Baffinland). It represents Golder's professional judgement based on the knowledge and information available at the time of completion. Golder is not responsible for any unauthorized use or modification of this document. All third parties relying on this document do so at their own risk.

The factual data, interpretations, suggestions, recommendations, and opinions expressed in this document pertain to the specific project, site conditions, design objective, development, and purpose described to Golder by Baffinland, and are not applicable to any other project or site location. In order to properly understand the factual data, interpretations, suggestions, recommendations, and opinions expressed in this document, reference must be made to the entire document.

This document, including all text, data, tables, plans, figures, drawings, and other documents contained herein, as well as all electronic media prepared by Golder are considered its professional work product and shall remain the copyright property of Golder. TABLES

1.0 INTRODUCTION

On May 10, 2016, Mr. James Millard, Baffinland Iron Mines Corporation (Baffinland) Environmental Manager, provided an email report to Mr. Curtis Didham, an Inspector designated by the Minister of Fisheries and Oceans (EO Didham), that on May 7, 2010, a snowmelt event occurred at the Mary River Project site that led to sediment-laden runoff flowing into Sheardown Lake. Further, on May 17, 2016, Mr. Allan Knight, Baffinland Environmental Superintendent, reported to Northern District Spills Duty Officer, EO MacDonald that a snowmelt event resulted in runoff containing sediments was observed to be flowing into Camp Lake Tributary #1 and into Camp Lake. EO MacDonald forwarded the report to EO Didham. These events, singularly and collectively, set in motion a process of sample collection, laboratory analysis, reporting, and ultimately resulted in a Baffinland site visit and inspection by EO Didham, Indigenous and Northern Affairs Canada (INAC) Water Resource Officers Justin Hack and Jonathan Mesher and INAC Environmental Assessment Officer Jason Patchell on May 18 and 19, 2016.

A number of outcomes resulted from the site visit and inspection of the Mary River Project site including a *Fisheries Act Direction* (FAD), dated June 7, 2016, to remedy a number of the immediate issues and to develop and implement two action plans by September 30, 2016:

1) A Dust Mitigation Action Plan with an implementation schedule addressing crushing operations, wind coming in contact with the crushed rock/iron stockpiles and vehicle traffic on the Tote Road; and

2) A Tote Road and Mine Haul Road Mitigation Action Plan with an implementation schedule addressing sediment water runoff from the road in to culverts, ditches and creeks/streams which lead to David, Mural, Kabikok, KM 32, KM 27, Camp and Sheardown Lakes, and into the Mary River and Phillips Creek.

The mitigation action plans were developed to address the specific areas noted in the FAD and to also address other areas on the site where dust and sediment could become an issue in the future. The mitigation action plans have been developed as separate deliverables consistent with the direction, but it is important to recognize that they are closely related to each other and will be synergistic when they are implemented together. This document deals specifically with Item 2, above. As this document includes the various sources of sediment at the Tote Road, the Mine Haul Road, the crusher pad, the Milne Port ore stockpile, and the Mine and Milne Port Sites, it is titled the *Sedimentation Mitigation Action Plan*.

Baffinland retained Golder Associates Ltd. (Golder) to prepare both the Dust Mitigation Action Plan and the Sedimentation Action Plan. The preparation of these plans included a site visit by Messrs. Chris Madland, Senior Air Quality Scientist, and Paul Bedell, PEng, Senior Geotechnical Engineer, of Golder from August 12 to August 16, 2016, inclusive. Extensive discussions between Baffinland personnel and Golder were carried out to develop the plans.

The Reader is referred to the Study Limitations (Section 9.0), which follows the text and forms an integral part of this document.

2.0 TOTE ROAD

The Tote Road extends from the Milne Port to the Mine Site and is approximately 104 km in length. The crushed ore is hauled to the Milne Port Ore Stockpile (Section 5.0) from the Crusher Pad (Section 4.0) by B-train haul trucks that traffic the Tote Road.

2.1 Sediment Sources

The following are identified as the primary sources of sediment water runoff from the Tote Road into culverts, ditches, creeks, and streams:

- Sediment-contaminated snow melt. Snow management practices have resulted in sediment-laden meltwater, from snow cleared from the road, reporting to the receiving environment.
- Road embankment erosion at some culvert locations. Steep road embankments, due to short culverts, are prone to erosion and challenge proper armouring with rip rap. Short culvert lengths also result in narrow road widths which result in traffic safety issues. The lack of sufficient rip rap placement at culverts inlets and outlets, even those with flatter slopes, also results in erosion of the road embankment.
- Insufficient drainage of the running surface resulting in runoff and erosion of running surface. Runoff along steeper sections of the road increases erosion of the road and sediment loading to the ditches and/or the receiving environment. Low-lying sections of the road are prone to the ponding of water, seasonally or as a result of rainfall events; these sections are prone to road deterioration and generate sediment-laden runoff to the ditches and/or receiving environment. Finer-grained road surfacing fills are especially prone to generating sediment, especially during intensive maintenance activities.
- Insufficient sizing and armouring of roadside ditches. Erosion of the ditches in steeper sections results in sediment-laden flows that report to the receiving environment.
- Cut-slope instability resulting from permafrost degradation. Ice-rich permafrost and fine-grained soils, upon thawing, result in sediment-laden flows to ditches, culverts, the road surface, and directly to the receiving environment. Cut-slopes into ice-rich permafrost and fine-grained and fine-grained soils exist at several locations along the Tote Road.

2.2 Mitigation Actions Undertaken to Date

Baffinland had undertaken a number of mitigation actions to reduce the adverse impacts of sedimentation on the receiving environment prior to the issuance of the FAD on June 7, 2016. These actions, in addition to those undertaken to the date of this document, include:

- Road resurfacing using high quality and durable granular fills. The placement of these fills has been carried out in select locations along the Tote Road as part of ongoing maintenance and upgrading activities. These fills satisfy the requirements for the Tote Road improvement design (prepared by Hatch Ltd.). Their placement will: reduce sediment generation due to their grain size; improve road drainage performance due to road embankment raising and crowning; and will reduce the generation of sediment-contaminated snow due to their grain size.

- Rip rap placement and check dam construction in roadside ditches. In excess of 4 km of ditch length was armoured with rip rap prior to the 2016 freshet between KM 83+000 and KM 89+000; steeper gradient sections of the road ditch were selectively targeted for rip rap placement. Several check dams were installed at select locations along the ditch to aid in flow control and to enable the use of flocculent. The installation of geotextile, underlying the rip rap, was carried out, in the majority of these areas.
- Rip rap placement at culvert inlets and outlets. The inlets and outlets of several culverts were armoured with rip rap prior to the 2016 freshet to reduce further erosion and generation of sediment.
- Installation of silt fencing, installation of geojute, and use of flocculation. These measures were used at select locations along the roadside ditch, upstream of culverts, and downstream of culverts to reduce the adverse impact of sediment-laded flows on the receiving environment.
- Removal of eroded materials from roadside ditch, creeks, and streams. Eroded materials, for example at KM 97+200 (bridge crossing), were removed from the steams in early 2016.
- Berm construction along the road from about KM 90+100 to KM 90+800 to limit movement of material mobilized from permafrost degradation in cut-slope. This berm was constructed using rip rap and served to retain materials.

2.3 Additional Mitigation Measures to be Undertaken

It is recognized that several mitigation measures need to be undertaken for the proper control of sediment impacts from the Tote Road. These measures need to be scheduled in consideration of seasonality, material availability, and resource requirements. The following general mitigation measures are recommended to be carried out by Baffinland:

- Procurement and bringing into use of a 6-way blade for the snow plows and evaluation of commercial-sized snow blowers for improved snow management based on ability to mobilize the equipment to the site.
- Development of a snow management plan for the Tote Road, including identification of snow dumps and snow clearing requirements, to manage the quantity and spatial extent of sediment-contaminated snow.
- Signage on all fisheries culverts at inlets and outlets.
- Replacement or extension of culverts to improve performance. Priority will be given to fish culverts and those identified having safety concerns. Armouring of culvert inlets and outlets with rip rap will be part of this work.
- Armouring and protection of cut-slopes exhibiting permafrost degradation to limit further erosion and sediment transport.
- Improve water management and drainage on the road surface and ditches. Placement of high quality and durable granular fills in select areas during road maintenance will be carried out. Armouring of ditches with rip rap will be carried out at identified locations to improve ditch performance; construction of check dams will be included in this work. The installation of silt fencing will be used, as required, to reduce the impact of sediment on the receiving environment.

- Removal of sediment laden snow from the ice surfaces of stream crossings.
- The Tote Road monitoring program will be revised. This will require regular visual inspections, including the documentation of areas of concern and required repairs.
- Develop and implement an earthworks execution plan for the Tote Road including; road re-surfacing, culvert replacement and other road improvements in consideration of the design prepared by Hatch Ltd. This requires that the carriageway be three times the width of the largest vehicle and with safety berms, in areas having a 3 m drop-off or greater, the berm having a height of three-quarters the diameter of the largest vehicle's tire; these are requirements of the *Mine Health and Safety Act* of Nunavut.

The summary of the specific mitigation actions recommended is shown in Table 1. The accountable department and completion date are shown for each mitigation action.

Table 1: Tote Road Sedimentation Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Revise and implement snow management plan	Ore Handling (support from Environment)	October 30, 2016
Signage posted on all fisheries culverts (inlets and outlets)	Environment	December 31, 2016
Procure and bring into use 6-way snow plow blade	Ore Handling	November 30, 2016
Replace CV104 culvert	Ore Handling	October 31, 2016
Increase road protection berms, rip rap culvert inlets/outlets, and replace non-functioning small diameter culverts (as required) between KM 90+100 and KM 90+800	Ore Handling	May 1, 2017
Construct water diversion ramps on running surface and check dams in ditch on slopes section near KM 97+200	Ore Handling	May 1, 2017
Remove sediment/dust-impacted snow from river ice surface (beneath bridges)	Ore Handling	As required (April 2017)
Prepare road improvement earthworks execution plan for 2017-and-beyond construction seasons	Ore Handling	February 15, 2017
Evaluate the potential to procure, transport and bring into use commercial-sized snow blower	Ore Handling	September 30, 2017
Replace priority culverts	Ore Handling	May 31, 2017
Execute earthworks execution plan for 2017 construction season - resurfacing	Ore Handling	December 31, 2017
Execute earthworks execution plan for 2017 construction season - balance of priority culverts	Ore Handling	December 31, 2017

3.0 MINE HAUL ROAD

The Mine Haul Road extends from the Crusher Pad (Section 4.0) about 6 km to the open pit. Blasted ore is loaded into CAT777 haul trucks and hauled to the Crusher Pad.

3.1 Sediment Sources

The following are identified as the primary sources of sediment water runoff from the Tote Road into culverts, ditches, creeks, and streams:

- Sediment-contaminated snow melt. Snow management practices have resulted in sediment-laden meltwater, from snow cleared from the road, reporting to receiving environment.
- Sediment from the low quality fills used in previous road embankment construction. These materials are prone to breaking down and are the sediment source to flows along the road surface.
- Cut-slope instability resulting from permafrost degradation. Ice-rich permafrost and fine-grained soils, upon thawing, result in sediment-laden flows to ditches, culverts, the road surface, and directly to the receiving environment. Cut-slopes into ice-rich permafrost and fine-grained and fine-grained soils exist at several locations along the Mine Haul Road.

3.2 Mitigation Actions Undertaken to Date

Baffinland had undertaken a number of mitigation actions to reduce the adverse impacts of sedimentation on the receiving environment prior to the issuance of the FAD on June 7, 2016. These actions, in addition to those undertaken to the date of this document, include:

- Six twin culverts and one single culvert were installed and the existing ditch was protected with rip rap along the mine haul road. The culvert trench was excavated by drilling and blasting due to the frozen ground conditions. The existing ditches were cleared of snow and inspected. Due to the time constraints and weather conditions the existing ditches were not modified. The existing ditches were observed to have little to no erosion protection. Rip rap was added along the length of the ditch, and in steep sections geotextile was placed prior to rip rap. This work was carried out and completed prior to the 2016 freshet.
- Road resurfacing using high quality and durable granular fills. The placement of these fills has been carried out since May 2016 in select locations along the Mine Haul Road as part of ongoing maintenance and upgrading activities. Their placement will: reduce sediment generation due to their grain size; improve road drainage performance due to road embankment raising and crowning; and will reduce the generation of sediment-contaminated snow due to their grain size.

3.3 Additional Mitigation Measures to be Undertaken

It is recognized that several mitigation measures need to be undertaken for the proper control of sediment impacts from the Mine Haul Road. These measures need to be scheduled in consideration of seasonality and material and resource requirements. The following general mitigation measures are recommended:

- Improve water management and drainage on the road surface through the placement of high quality and durable granular along the entire Mine Haul Road. The placement of these durable fills will encapsulate the lower quality fills within the original road embankment to limit further degradation and reduce the ability for sediment generation.
- Revision of the snow management plan for the Mine Haul Road, including identification of snow dumps and snow clearing requirements, to manage the quantity and spatial extent of sediment-contaminated snow.
- Enact a program of sediment removal from the culvert inlet basins on an “as required” basis.
- Armouring and protection of cut-slopes exhibiting permafrost degradation to limit further erosion and sediment transport.
- A Mine Haul Road monitoring program will be developed. This will require regular visual inspections by including the documentation of areas of concern and required repairs.

The summary of the specific mitigation actions recommended is shown in Table 2. The accountable department and completion date are shown for each mitigation action.

Table 2: Mine Haul Road Sedimentation Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Revise and implement snow management plan	Mine Operations (support from Environment)	October 15, 2016
Develop strategy to manage flows on running surface	Mine Operations	March 31, 2017
Remove sediment from culvert inlet basins	Mine Operations	As required
Running surface resurfacing	Mine Operations	September 30, 2017
Develop requirements for area downstream of Mine Haul Road and culverts (permafrost degradation area)	Mine Operations	March 31, 2017
Implement strategy to manage flows on running surface	Mine Operations	September 30, 2017
Implement short term mitigation for area downstream of Mine Haul Road and culverts	Mine Operations (support from Environment)	March 31, 2017

4.0 CRUSHER PAD

The Crusher Pad is the location where ore, hauled from the open pit, is crushed, stockpiled, and loaded into B-train trucks for haulage to the Milne Port Stockpile (Section 5.0). Two ore crushing setups and a single aggregate crushing setup are located on the Crusher Pad. The aggregates produced at the Crusher Pad are used across the site, as required, for granular fills.

4.1 Sediment Sources

The following are identified as the primary sources of sediment water runoff from the Tote Road into culverts, ditches, creeks, and streams:

- Sediment-contaminated snow melt. Snow management practices have resulted in sediment-laden meltwater, from snow cleared from the Crusher Pad, reporting to receiving environment.
- Sediment-contaminated snow from wind-blown dust generated during ore and aggregate crushing and loading activities.

4.2 Mitigation Actions Undertaken to Date

Baffinland had undertaken a number of mitigation actions to reduce the adverse impacts of sedimentation on the receiving environment prior to the issuance of the FAD on June 7, 2016. These actions, in addition to those undertaken to the date of this document, include:

- Maintenance to the Crusher Pad surface to improve runoff management. This work included the placement of granular fills and the re-grading of the pad surface resulting in better runoff management. Runoff is directed to the collection sump adjacent to the Crusher Pad.
- Reconfiguration and armouring of the south bank of the Crusher Pad. Material was removed and rip rap was placed to reduce the erosion of finer-grained fills.

4.3 Additional Mitigation Measures to be Undertaken

It is recognized that several mitigation measures need to be undertaken for the proper control of sediment impacts from the Crusher Pad. The following general mitigation measures are recommended:

- Revision of the snow management plan for the Crusher Pad, including identification of snow dumps and snow clearing requirements, to reduce the quantity and limits of sediment-contaminated snow.
- Installation of a downwind snow fence system (nominally on the south and southeast margins of the Crusher Pad) to test the ability of snow fence to manage the spatial extent of wind-blown sediments and sediment-laden snow and to permit the efficient removal of sediment laden snow, should it become apparent over the winter season.
- Develop the design of a potential sedimentation pond system in the drainage adjacent to the Crusher Pad. This design would be constructed should the dust mitigation actions to reduce dust fall from the Crusher Pad be insufficient. This design will be prepared such that it can be constructed in the summer of 2017, if required.

The summary of the specific mitigation actions recommended is shown in Table 3. The accountable department and completion date are shown for each mitigation action.

Table 3: Crusher Pad Sedimentation Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Revise and implement snow management plan	Crushing (support from Environment)	October 31, 2016
Design potential downstream sedimentation pond system as a contingency measure	Crushing (support from Environment)	February 28, 2017

5.0 MILNE PORT ORE STOCKPILE

The Milne Port Ore Stockpile is the location for ore storage prior to loading and shipping. Ore hauled from the Crusher Pad (Section 4.0) along the Tote Road (Section 2.0) is stockpiled at the Milne Port Ore Stockpile facility using loaders and conveyors for stacking. Ships are loaded using the ship loader; this is fed by loaders and conveyors.

5.1 Sediment Sources

The following is identified as the primary sources of sediment water runoff from the Milne Port Ore Stockpile facility:

- Sediment-contaminated snow melt from the stockpile area and on the beach area.

5.2 Mitigation Actions Undertaken to Date

Baffinland had undertaken a number of mitigation actions to reduce the adverse impacts of sedimentation on the receiving environment prior to the issuance of the FAD on June 7, 2016. These actions, in addition to those undertaken to the date of this document, include:

- Construction of ditching around the perimeter of the stockpile facility to intercept and route runoff to the sedimentation ponds.
- Removal of contaminated snow from the beach. This activity is carried out prior to the onset of melting conditions.

5.3 Additional Mitigation Measures to be Undertaken

It is recognized that several mitigation measures need to be undertaken for the proper control of sediment impacts from the Milne Port Ore Stockpile facility. The following general mitigation measures are recommended:

- Revision of the snow management plan for the facility, including identification of snow dumps and snow clearing requirements, to reduce the quantity and limits of sediment-contaminated snow.
- Installation of a downwind snow fence system (nominally on the northwest margins of the Milne Port Ore Stockpile facility) to test the ability of snow fence to manage the spatial extent of wind-blown sediments and sediment-laden snow and reduce the amount of sediment laden snow that requires management..
- Removal of contaminated snow from the beach. This activity will be carried out prior to the onset of melting conditions.

The summary of the specific mitigation actions recommended is shown in Table 4. The accountable department and completion date are shown for each mitigation action.

Table 4: Milne Port Ore Stockpile Sedimentation Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Revise and implement snow management plan	Ore Handling (support from Environment)	October 31, 2016
Remove dust-impacted snow from beach area	Ore Handling	As required

6.0 MINE AND MILNE PORT SITES

There are a number of locations at the Mine and Milne Port Sites from which sedimentation may be generated. These include pads, laydowns, and parking areas and their associated drainage infrastructure.

6.1 Sediment Sources

The following are identified as the primary sources of sediment water runoff from the Mine and Milne Port Sites:

- Camp Lake jetty ditching handling runoff from the apron and pad area.
- Sediment-contaminated snow melt from various pads, laydowns, and parking areas.

6.2 Mitigation Actions Undertaken to Date

Baffinland had undertaken a number of mitigation actions to reduce the adverse impacts of sedimentation on the receiving environment prior to the issuance of the FAD on June 7, 2016. These actions, in addition to those undertaken to the date of this document, include:

- Remediation of slope at north end of airstrip. This area experienced erosion of material due to concentrated water flow from the airstrip apron. Some of the material was removed from the toe of the slope. The slope was covered with rip rap and stabilized.
- Remediation of ditch and outflow area at Camp Lake Jetty. Sedimentation ponds were constructed and commissioned to flocculate flows prior to their release to Camp Lake.

6.3 Additional Mitigation Measures to be Undertaken

It is recognized that several mitigation measures need to be undertaken for the proper control of sediment impacts from the Mine and Milne Sites. The following general mitigation measures are recommended:

- Revision of the snow management plan, including identification of snow dumps and snow-clearing requirements, to reduce the quantity and limits of sediment-contaminated snow.
- Construction of a series of check dams along the Camp Lake jetty ramp ditch.

The summary of the specific mitigation actions recommended is shown in Table 5. The accountable department and completion date are shown for each mitigation action.

Table 5: Mine and Milne Sites Sedimentation Mitigation Actions and Implementation Schedule

Action	Accountable Department	Completion Date
Revise and implement snow management plan	Site Services (support from Environment)	September 30, 2016
Construct and improve check dams in ditch along ramp to Camp Lake jetty	Site Services	October 30, 2016

7.0 SUMMARY AND RECOMMENDATIONS

This document presents the Sedimentation Mitigation Action Plan for the Mary River Project prepared in response to the FAD issued to Baffinland on June 7, 2016. The implementation schedule for each mitigation action is also presented herein. A requirement of the FAD was that Baffinland also prepare and submit a Dust Mitigation Action Plan; the action plans have been developed as separate deliverables consistent with the direction, but it is important to recognize that they are closely related to each other and will be synergistic when they are implemented together.

It is recommended that Baffinland complete all of the listed mitigation actions to reduce the impacts of sediment on the receiving environment. Specific attention is drawn to the following through the following recommendations:

- Procure and bring into use proper snow removal equipment, including 6-way blades and evaluate the use of commercial-sized snow blowers, when it is possible to transport the equipment to the site.
- Revise and implement snow management plans for each of the areas on the site prior to the onset of winter conditions in 2016. A stand-alone plan for each facility or an overall project site plan, with a section for each area, may be prepared.
- Develop and implement a road improvement earthworks plan for 2017 for the Tote Road. A significant amount of work, including culvert lengthening and replacement, road widening, rip rap placement, ditch upgrading, and road surfacing, is required to reduce sediment generation from the road. Proper scheduling to complete this work must be developed in consideration of seasonality constraints and to determine material and resource requirements. The implementation the upgrade design to satisfy the requirements of the *Mine Health and Safety Act* of Nunavut is required to be part of this work.
- Performance of regular inspections of the Tote Road and Mine Haul Road to identify conditions of concern and required maintenance work.

8.0 CLOSING

Inspectors Statement

On May 18-20, 2016, a water licence inspection was conducted at the Mary River Project, Qikiqtani Region, Nunavut. Sites inspected included the Mary River Mine Site, the Tote Road and related infrastructure, and the Milne Port area.

Weather Conditions on Site

The site remained largely snow covered at the time of the inspection; however, due to unusually warm weather freshet had just begun causing significant snowmelt to enter watercourses.

Summary of Report

At the time of inspection, the Licensee was undertaking activities related to the operation of an open-pit iron ore mine at the Milne Port (Milne Inlet), Mine site (Mary River), Tote Road. Most major construction activities have finished and BIMC is primarily mining ore and transporting it to Milne Port in preparation for open water season.

Prior to the Inspection, BIMC has reported high levels of suspended solids are entering watercourses. This has been reported to relevant parties through Spill Report #: 16-158, 16-176, 16-181.

During the inspection, it was evident that sediment entering watercourses was a concern. Water flowing within the water courses at Mary River and along the Tote Road was significantly discoloured, amplified by the effect of iron oxidation. While on site, it was observed that sediment entering water was a consequence of:

- Over winter dust accumulation on the snow from project activities (i.e. crushing ore and material, transporting material on the Tote Road, and storing material in stockpiles). Snow stained with red iron dust is evident throughout the site,
- snowmelt entering watercourses with dust entrained in the snow,
- run-off from the road surface,
- surface water management structures not fully implemented to proactively deal with freshet and manage erosion and sedimentation; and,
- recent and continued construction of infrastructure.

Due to the concerns of sediment entering watercourses, BIMC has committed to implementing a plan to address the sedimentation of watercourses around the site. This plan is to be provided to the Inspector by June 22 2016, and is to outline specific measures to be implemented within the 2016 season to effectively deal with sedimentation entering watercourses and to address freshet 2017.

SECTION 2 ☐ **Comments** ☐ **Non-Compliance with Act or Licence** ☒ **Action Required**

Water Management Structures:

1. Ore Stockpile Pad Diversion Ditches and Ore Stockpile Settling Ponds at Milne Inlet
    a. No snow was contained on the Ore Stockpile Pad; however, significant water was present within the facility.
    b. During this inspection it was noted that the ore stockpile diversion ditches and the ore stockpile settling ponds were still not completed.
    c. BIMC has not met the deadline they committed to in June 2016 whereas diversion ditches and the settling ponds would be properly commissioned prior to freshet 2016.
    d. *INAC* was not informed prior to freshet 2016 that this commitment would not be met.
    e. Following the inspection, BIMC has submitted a plan entitled, "*Milne Stockpile Pad Water Drainage System – Execution Plan and Schedule,*" whereas BIMC has again committed to completing this work prior to July 18, 2016.
2. Water Management Structures along the Tote Road
    a. In previous inspections, it was recommended that BIMC proactively identify areas that are more prone to silt-loading and implement appropriate sedimentation mitigation measures. The location near to David Lake, KM78 to KM86, was identified as a high risk area.
        i. Specifically, BIMC committed to installing armour stone in ditches that receive high levels of flow prior to Freshet 2016.
        ii. At the time of the inspection, appropriate sedimentation mitigation measures were not installed in areas of high risk.
        iii. *INAC* was not informed prior to freshet 2016 that this commitment would not be met.
        iv. BIMC has committed to developing a plan with timelines and measureable deliverable to address their erosion prevention measures on the Tote Road prior to June 22, 2016.
3. Water Management Structures along the Mine Haul Road
    a. BIMC has completed significant work, since the last inspection on the Mine Haul Road, to deal with erosion and sedimentation.
        i. Ditches along this road were armoured with rip-rap.
        ii. Water was being effectively diverted into these ditches and then into small sedimentation ponds before entering culverts.
        iii. Armouring stone was installed downstream of culverts to reduce sedimentation and erosion.
    b. Water accumulating on the road was being diverted to temporary road drainage structures.
4. Ore Crushing Area and associated Sedimentation Ponds
    a. In the previous inspection, there were concerns with the erosion protection deficiencies along the natural drainage edge of this facility as well as minor tear/punctures in the liner.
        i. It was observed during the inspection that the previous concerns noted have been addressed. Rip-rap has been installed along the natural drainage edge and minor punctures have been repaired.
    b. During this inspection, water was pooling in the ore crushing area.
    c. Prior to the inspection, a sinkhole formed within the facility likely from excess water accumulation.
    d. It is recommended that BIMC grade the ore crushing area to properly drain the facility towards the sedimentation ponds.
5. Waste Rock Pile water collection pond
    a. At the time of the inspection, the waste rock pile water collection pond was currently being commissioned.
    b. Interceptor ditches not yet completed.
    c. No major concerns with this structure.

Sedimentation:

6. During the inspection, there were significant sedimentation and erosion events (as indicated by red rust coloured water) actively occurring within watercourses along the Tote Road and entering David Lake, Mural Lake, Kabikok Lake, Sheardown Lake (see *Photo 1*), Camp Lake (*see Photo 2*), Mary River and Phillips Creek.
    a. The cause of this sedimentation and erosion events is likely loose soils becoming suspended during higher flow events, run-off of water from the Tote Road, and from dust entrained within snow (resulting the crusher, the tote road and the ore stockpile) melting and entering the watercourses.
    b. During freshet it was observed that BIMC prioritized sedimentation control measures in certain streams; however, the extent of the sedimentation event was too large to control with reactionary measures.
    c. Significant pre-planned sedimentation control measures prior to sedimentation events are likely required to meet conditions of the Water Licence.

   d. Water samples were taken by the Inspector to confirm water quality at Sheardown Lake Tributary 1, and a small tributary entering Camp Lake.
      i. The water quality sample at Sheardown Lake Tributary 1 had a Total Suspended Solid (TSS) result of 50.4mg/L. This level is within the Effluent Quality Limits for Surface Runoff during the Construction phase as construction was occurring directly upstream of this sample location.
      ii. The water quality sample taken at the stream entering Camp Lake near the monitoring location MS-MRY-1 had a TSS result of 114mg/L. This sample exceeded all effluent quality limits within the licence.
      iii. **A letter of Non-Compliance has been issued as a warning to BIMC because previous commitments were not addressed to mitigate the effects of sediment loading to water.**

7. Bridges along Tote Road
   a. During wet conditions on the Tote Road, it was noted that road material is being pushed into all water courses that are crossed by a bridge.
   b. During the inspection, there was significant sediment on snow below the bridge (see *Photo 3*).
   c. It is requested that BIMC address this concern in their plan due June 22, 2016 which is to address sedimentation issues along the Tote Road.

<u>Sites of Concern noted from Previous Inspections:</u>

Water Management Structures:

Mine Site

8. Jetty at Camp Lake
   a. Significant erosion has occurred at the Jetty at Camp Lake. Further erosion and sedimentation is likely to occur if this issue is not addressed.
   b. BIMC has provided a schedule and plan on timelines to address this concern:
      i. In Late June 2016: install silt curtains around the facility.
      ii. In July 2016: complete work on the structure.
9. Jet Fuel Tank Farm Containment at Aerodrome
   a. During a previous inspection, it was noted that the crest and profile of the embankments were not maintained.
   b. During the May 2016 inspection the berms/ embankments appeared to be well maintained.
10. Bulk Fuel Storage Facility Containment.
   a. The embankment crest and some side slopes were not maintained to the design profile as required.
   b. During the May 2016 inspection this structure was not inspected, INAC will follow up in the next inspection.
11. Hazardous Waste Containment
   a. During a previous inspection, it was noted that the crest width and profiles of some of these facilities near the aerodrome were not in good shape. There were indications of manoeuvring of tracked machinery over the embankment resulting in a disturbed embankment profile. It is recommended these containments receive maintenance.
   b. During the May 2016 inspection this structure was not inspected, INAC will follow up in the next inspection.

Milne Port Site

12. Hazardous Waste Containment Facility
   a. During a previous inspection, it was noted that some of the berm crest widths and profiles were not in good shape and there were indications or manoeuvring of tracked machinery over the berms.
   b. It is suggested that these containments be sign-posted warning of the shallow cover material thickness over the liner limiting traffic movements and caution when placing heavy, sharp, or other large objects which may have the potential to puncture the liner.
   c. BIMC has addressed this and said consideration is being given to the strategic installation of barriers and/or signs.
   d. During the May 2016 inspection this structure was not inspected, INAC will follow up in the next inspection.

Materials Storage:

13. Calcium Chloride Storage Area
   a. It is recommended that a perimeter berm/drainage ditch be installed to route the runoff away from the storage and down the slope hill to the drainage ditch along the Tote Road as a preventative measure.
   b. BIMC has committed to visual monitoring and flow mapping of the area during Freshet 2016 and that drainage measures will be implemented as appropriate.
   c. During the May 2016 inspection this structure was not inspected, INAC will follow up in the next inspection.

Waste Water:

14. Accumulated Water at the new maintenance building at KM60 on the Tote Road
    a. During a previous inspection concern was expressed on how BIMC would deal with accumulated wastewater within this facility.
    b. BIMC has provided justification that water will not accumulate within this facility or migrate from this facility. BIMC has committed to monitor this structure.

SECTION 1 ☒ **Comments** ☐ **Non-Compliance with Act or Licence** ☐ **Action Required**

Inspectors Statement

On July 6-8 2016, a water licence inspection was conducted at the Mary River Project, Qikiqtani Region, Nunavut. Sites inspected included the Mary River Mine Site, the Tote Road and related infrastructure, and the Milne Port area.

Weather Conditions on Site

Temperatures of approximately 20°C, partially cloudy and no snow remained on site.

Summary of Report

At the time of inspection, the Licensee was undertaking activities related to the operation of an open-pit iron ore mine at the Milne Port (Milne Inlet), Mine site (Mary River), Tote Road. Most major construction activities have finished and BIMC is primarily mining ore and transporting it to Milne Port in preparation for ore transportation.

During the Water Licence Inspection in May 2016, it was observed that commitments made by BIMC to complete the Ore Stockpile Pad Diversion Ditches and commitments to address areas prone to sedimentation along the Tote Road were not met. A Letter of Non-Compliance was issued to BIMC outlining deadlines to complete this work and a warning that further enforcement measures may be taken if reasonable diligence towards meeting the requirement of their licence, Part D, are not addressed.

Since the May inspection, significant work has been completed related to addressing the sedimentation issues around site and completing the Ore Stockpile Diversion ditches. BIMC has committed, until the submission of the Tote Road and Mine Haul Road Mitigation Action Plan on September 30, 2016 to submit bi-weekly updates regarding work related to this concern.

SECTION 2 ☐ **Comments** ☐ **Non-Compliance with Act or Licence** ☒ **Action Required**

Water Management Structures:

1. Waste Rock Pile Sedimentation Pond
   a. At the time of the inspection, it was observed that run-off at the Waste Rock Pile Sedimentation pond was not being properly diverted to the sedimentation pond.
   b. BIMC committed to addressing the surface water run-off concern of this facility by July 22, 2016.

   c. Follow-up will be completed at the next inspection.
2. Ore Stockpile Pad Diversion Ditches and Ore Stockpile Settling Ponds at Milne Inlet
   a. A Letter of Non-Compliance was issued regarding the commitments not achieved after the May 2016 Inspection.
   b. In a response provided to the Inspector prior to this inspection, BIMC has submitted a plan entitled, "*Milne Stockpile Pad Water Drainage System – Execution Plan and Schedule*" whereas work was planned to be completed by June 22, 2016.
   c. Completed work was confirmed to have occurred on this structure during the inspection.
3. Water Management Structures along the Tote Road
   a. Due to the significant sedimentation of waterways around the project, a *Letter of Non-Compliance* was issued to BIMC to address this issue.
   b. In response to the Letter of Non-Compliance, BIMC has made significant progress related to mitigating sedimentation events from project activities.
   c. Updates are being provided by BIMC in bi-weekly reports of any new work associated with addressing and mitigating sedimentation of waterways along the Tote Road.
   d. On September 30, 2016 a Tote Road and Mine Haul Road mitigation action plan is due to Environment and Climate Change Canada that will provide an implementation schedule addressing sediment water runoff from the road into culverts, ditchers, and creeks/streams which leads to David Lake, Mural Lake, Kabikok Lake, KM32 Lake, KM27 Lake, Camp Lake, Sheardown Lake, Mary River, and Phillips Creek.

Culverts/Bridges

4. Bridges along Tote Road
   a. In a previous inspection it was noted that road material was being pushed into water courses that are crossed by a bridge.
   b. In the report submitted June 24, 2016 BIMC provided documentation that this issue was addressed.
5. Culverts
   a. Previous concerns related to culverts management and maintenance is being addressed in the Tote Road and Mine Haul Road mitigation action plan due September 30, 2016.

Materials Storage

6. Ore Crushing Area and associated Sedimentation Ponds
   a. This structure was previously identified by BIMC as encroaching onto a nearby stream.
      i. At the time of this inspection, BIMC was conducting work to remove a section of the ore crushing area pad away from the stream.
      ii. Significant erosion and sedimentation control measures were in place during this activity.
   b. Another concern that was noted in a previous inspection was the drainage of the facility.
      i. BIMC has installed culverts and graded the facility to help channel water to the sedimentation pond.

<u>Sites of Concern noted from Previous Inspections:</u>

Water Management Structures:

Mine Site

7. Jetty at Camp Lake
   a. Silt curtain were installed in July to prevent further damage to the structure.
   b. On August 23, 2016 BIMC provided notice that there have been delays in making the required repairs to the jetty due to logistical problems.
   c. BIMC has committed to finalizing the work before freeze-up.
8. Bulk Fuel Storage Facility Containment.
   a. The embankment crest and some side slopes were not maintained to the design profile as required.
   b. During the July 2016 inspection the berms/embankments appeared to be well maintained.
9. Hazardous Waste Containment
   a. During a previous inspection, it was noted that the crest width and profiles of some of these facilities near the aerodrome were not in good shape. There were indications of manoeuvring of tracked machinery over the embankment resulting in a disturbed embankment profile. It is recommended these containments receive maintenance.
   b. During the July 2016 inspection the berms/embankments appeared to be well maintained.

Milne Port Site

10. Hazardous Waste Containment Facility
   a. During a previous inspection, it was noted that some of the berm crest widths and profiles were not in good shape and there were indications or manoeuvring of tracked machinery over the berms.
   b. During the May 2016 inspection this structure was not inspected.
   c. During the July 2016 inspection it was noted that there was evidence of water within the facility close to overtopping at the spillway.

d. Sufficient freeboard must be maintained at this facility.

Materials Storage:

11. Calcium Chloride Storage Area
    a. It is recommended that a perimeter berm/drainage ditch be installed to route the runoff away from the storage and down the slope hill to the drainage ditch along the Tote Road as a preventative measure.
    b. BIMC has committed to visual monitoring and flow mapping of the area during Freshet 2016 and that drainage measures will be implemented as appropriate.
    c. This facility was inspected and no concerns were noted.

SECTION 1 ☒ **Comments** ☐ **Non-Compliance with Act or Licence** ☐ **Action Required**

Inspectors Statement

On September 28-29 2016, a water licence inspection was conducted at the Mary River Project, Qikiqtani Region, Nunavut. Sites inspected included the Mary River Mine Site, the Tote Road and related infrastructure, and the Milne Port area.

Weather Conditions on Site

Temperatures were approximately -2°C with snow cover. Large water bodies remained unfrozen, while smaller streams and water in containment was frozen.

Summary of Report

At the time of inspection, the Licensee was conducting activities related to the mining of iron ore, which includes blasting, crushing and transporting ore to Milne Port to an awaiting ship.

Due to the significant snow cover on site and the frozen conditions it was difficult to conduct a thorough inspection. All major activities related to the use of water and deposits of waste were inspected.

Baffinland has submitted a Dust Mitigation Action Plan and a Sedimentation Mitigation Action Plan to address the ongoing concerns with dust, sedimentation and erosion on site.

No major concerns are noted in this report

SECTION 2 ☐ **Comments** ☐ **Non-Compliance with Act or Licence** ☒ **Action Required**

Water Management Structures:

1. Waste Rock Pile Sedimentation Pond and Surface Water Management Ditches
   a. BIMC explained that proper diversion ditches for this facility were constructed as noted in a previous inspection.
   b. During inspection, snow cover prevented proper inspection of this facility.
   c. Follow-up will be conducted when snow melts.
2. Crusher Pad Construction

a. A recent expansion of this facility was completed.
b. It was noted previously that BIMC had installed mitigation measures to address sedimentation during construction.
c. At the time of this inspection, BIMC left the mitigation measures in place to address possible sedimentation during spring melt.

3. Crusher Pad Sedimentation Pond
    a. Significant snow cover prevented proper inspection of this facility; however, no signs of leaks were apparent.
4. Ore Stockpile Sedimentation Pond West
    a. During the Jul 2016 Geotechnical Inspection, it was identified that there is concern over the stability of the liner in this pond.
    b. Furthermore, culvert inlet is possibly allowing water to flow under the liner. This must be repaired during the next construction season.
5. Ore Stockpile Sedimentation Pond East
    a. At the time of the inspection, the water within the pond was approximately 30cm from overtopping. It was recommended to BIMC that this pond be decanted to prevent uncontrolled discharge from this facility.
6. Hazardous Waste Berms (MS-HWB1 to 6, and MP-HWB-1, MP-HWB-3 to 5)
    a. All hazardous waste berms were inspected.
    b. All waste was contained within the facility and no signs of leaks were apparent.
7. Polishing Waste Stabilization Ponds (Three Ponds at Mary River and One Pond at Milne Port)
    a. Significant snow cover prevented a proper inspection; however, no signs of leaks in the berm walls or tears in the liner were apparent.
8. Ore Stockpile Pad Diversion Ditches
    a. No concerns related to this infrastructure.
9. Contaminated Snow Containment Facility
    a. Significant snow cover prevented proper inspection of this facility; however, no signs of leaks were apparent.
10. Landfarm Facility
    a. Significant snow cover prevented proper inspection of this facility; however, no signs of leaks were apparent.
11. Bulk Fuel Storage Facility at Mine Site, Aerodrome, and Milne Port
    a. No concerns with these structures.

Water Use:

12. Records for water use were in good order at the time of the inspection at both Milne Port and Mary River Mine Site.
13. At the time of the inspection, water was primarily being used to support camp functions.

Waste Discharges:

14. BIMC was discharging sewage waste as intended. No other discharges of wastes were occurring during the inspection.
15. Records of sewage discharges were in good order.

Erosion and Sedimentation

16. General Site Comment
    a. Due to the significant sedimentation of waterways around the project, a *Letter of Non-Compliance* was issued to BIMC to address this issue.
    b. In response to the Letter of Non-Compliance, BIMC has made significant progress related to mitigating sedimentation events from project activities.
    c. On September 30, 2016 a Dust Mitigation Action Plan and a Sedimentation Mitigation Action Plan was submitted by BIMC to address the concerns over Dust and Sedimentation on site.
17. Jetty at Camp Lake
    a. The construction of this structure was complete at the time of the inspection.
    b. Proper sedimentation measures were installed during construction.

Culverts/Bridges

18. Bridges along Tote Road
    a. In a previous inspection it was noted that road material was being pushed into water courses that are crossed by a bridge.
    b. BIMC has developed a plan to minimize the amount of road material entering major water courses.
    c. This will be monitored during future inspections.

Re: Response to INAC June, July, and September 2016 Inspection Findings for Mary River Project, Type A Water Licence 2AM-MRY1325 Amendment No.1, Type B Water Licence 2BE-MRY1421, and Land Use Permits N2014X0012, N2014Q0016, N2014C0013
Dear Mr. Hack:

This letter provides Baffinland Iron Mines Corporation's (Baffinland) response to Indigenous and Northern Affairs Canada (INAC) Inspections that were conducted on the following dates under the above referenced Water Licences and Land Use Permits: May 18 to 20, July 6 to 8, and September 28 to 29.

We attach Tables A.1, A.2, and A.3 which provide Baffinland's responses to concerns and comments provided in the Inspection Reports received by Baffinland on June 16, September 13, and November 9, 2016, respectively.

Please do not hesitate to contact us should you have any further comments or questions.

Sincerely,

James Millard
Environmental Manager

Table A.1 - Baffinland Response to INAC Water Licence Inspection Report, Dated June 16, 2016 (Inspection Dates May 18 to May 20)

ITEM No.[1]	Observation or Item of Concern	Baffinland Responses
Waste Management Structures:		
1	***Ore Stockpile Pad Diversion Ditches and Ore Stockpile Settling Ponds at Milne Inlet*** *- significant water within the Ore Stockpile Pad* *- diversion ditches and the ore stockpile settling pond still not completed* *- not met the deadline committed to in June 2015 whereas the diversion ditches and the settling ponds would be properly commissioned prior to freshet 2016* *- INAC was not informed prior to freshet 2016 that this commitment would not be met*	Following the inspection, BIMC submitted a plan entitled, "*Milne Stockpile Drainage System - Execution Plan and Schedule* " (May 23, 2016). The construction of the diversion ditches commenced in late May and was substantially completed in mid-June.
2	***Water Management Structures along the Tote Road*** *- BIMC committed to installing armour stone in ditches that receive high levels of flow, specifically location near David Lake, Km78 to Km86, prior to freshet 2016.* *- Appropriate sedimentation mitigation measures were not installed in areas of high risk* *- INAC was not informed prior to freshet 2016 that this commitment would not been met*	Following the inspection, BIMC retained OPC North in late May to manage the implementation of sedimentation mitigation measures along the Tote Road, including check dam construction, roadside ditch armouring using rip-rap and geotextile, silt fence installation and the reinforcement of erosion prone slopes. The majority of the work was completed between km 77 - 100 of the Tote Road and focused on the concerns identified during the May inspection. Additional details are provided in the biweekly update reports and completion report provided to Environment and Climate Change Canada (ECCC) and INAC in response to the Fisheries Act Direction and INAC Letter of Non-Compliance. Moreover, as part of the Sedimentation Mitigation Plan submitted to ECCC and INAC on September 29, 2016, BIMC is currently finalizing a Tote Road Earthworks Execution Plan (TREEP) to address outstanding concerns along the Tote Road. The TREEP will outline timelines and measurable deliverables and will discuss the planned road upgrades and sedimentation mitigation measures to be completed along the Tote Road in the future.
4	***Ore Crushing Area and associated Sedimentation Ponds*** *- water pooling in the ore crushing area* *- sinkhole formed within the facility likely from excess water accumulation* *- recommend that BIMC grade the ore crushing area to properly drain the facility towards the sedimentation ponds*	During early July, the Mine Site Crusher Pad was recontoured to optimize surface water drainage on the pad. Moreover, in accordance with the facility design intent a perimeter ditch was completed around the crusher pad to redirect runoff to the crusher pad sedimentation pond.
5	***Waste Rock Pile water collection pond*** *- waste rock pile water collection pond currently being commissioned* *- intercept ditches not yet completed* *- No major concerns with this structure*	The Waste Rock Settling Pond was completed in May 2016. Modifications were made to the ditching and diversion structures throughout the summer to ensure effective direction of surface water drainage. Nuna East was contracted to recontour and modify the water management infrastructure (sedimentation pond, drainage ditching, diversion berms) associated with the waste rock stockpile and pond. These modifications were effective in directing most runoff originating from the waste rock stockpile to the sedimentation pond.

Sedimentation:		
6	***Significant sedimentation and erosion events during the inspection*** *- indicated by red rust coloured water actively occurring within water courses along the Tote Road and entering David Lake, Murial Lake, Katiktok Lake, Sheardown Lake, Camp Lake, Mary River and Phillip's Creek.* *- likely caused by loose soils becoming suspended during higher flow events, runoff of water from the Tote Road, and from dust entrained within snow melting and entering watercourses.* *- during freshet it was observed sedimentation control measures prioritized in certain streams; however, the extent of the sedimentation event was too large to control with reactionary measures.* *- significant pre-planned sedimentation control measures prior to sedimentation events are likely required to meet conditions of the Water Licence.* *- Water samples taken by the Inspector at Sheardown Lake Tributary 1 had a TSS result of 50.4 mg/L. - within the Effluent Quality Limits for Surface Runoff.* *- Water sample taken at the stream entering Camp Lake had a result of 114 mg/L - exceeded effluent quality limits within the licence.* *- A letter of Non-Compliance has been issued as a warning to BIMC because previous commitments were not addressed to mitigate the effects of sediment loading to water.*	Refer to the biweekly update reports and completion report submitted by BIMC to Environment and Climate Change Canada and INAC in response to the Fisheries Act Direction and INAC Letter of Non-Compliance.
7	***Bridges along the Tote Road*** *- during wet conditions on the Tote Road, it was noted that road material is being pushed into all water courses that are crossed by a bridge.* *- during the inspection, there was significant sediment on the snow below the bridges.* *- it is requested this concern be addressed in the plan due June 22, 2016 which is to address sedimentation issues along the Tote Road.*	Following the inspection, attempts were made to clear snow under the bridges along the Tote Road, and the surface of the bridges were cleared of muddy material by means of manual methods. Additional details are provided in the biweekly update reports and completion report provided to Environment and Climate Change Canada (ECCC) and INAC in response to the Fisheries Act Direction and INAC Letter of Non-Compliance. Material is not be deliberately pushed into the water, rather material that falls off the trucks and other equipment drops through gaps in the bridge. The issue was addressed in so far as road materials that fell on the ice below the bridges were scraped up prior to freshet. The design of each bridge is such that some road material will fall through the gaps, however, the gaps are an integral design feature of the bridges. More study of this design challenge is required. Baffinland will keep you notified of our work in this regard.

Sites of Concern from Previous Inspections		
Water Management Structures:		
Mine Site		
8	***Jetty at Camp Lake*** *- Significant erosion has occurred at the Jetty at Camp Lake. Further erosion and sedimentation is likely to occur it the issue is not addressed.* *- BIMC has provided a schedule and plan on timelines to address this concern:* *- In Late June: install silt curtains around the facility* *- In July 2016: complete work on the structure.*	Silt curtains were installed around the perimeter of the Camp Lake Water Jetty during mid-July. In mid-September, the jetty was repaired and armoured along its perimeter in order to prevent similar erosion events from occurring in the future.
9	***Jet Fuel Tank Farm Containment at Aerodrome*** *- During a previous inspection, it was noted that the crest and embankments were not maintained.* *- During the May 2016 inspection the berms and embankments appeared to be well maintained.*	Noted.
10	***Bulk Fuel Storage Facility Containment*** *- The embankment crest and some side slopes were not maintained to the design profile as required* *- During the May 2016 inspection this structure was not inspected, INAC will follow up in the next inspection*	The embankment crest and slide slopes of the Mine Site Bulk Fuel Storage Facility have been recontoured to reflect the design profile.
11	***Hazardous Waste Containment*** *- During a previous inspection, it was noted that the crest width and profiles of some of these facilities near the aerodrome were not In good shape. There were indications of maneuvering of tracked machinery over the embankments resulting in a disturbed embankment profile. It is recommended these containments receive maintenance* *- During the May 2016 inspection this structure was not inspected, INAC will follow up in the next inspection.*	The issue has been brought up by supervisors to their team members and the berms are monitored to ensure no further disturbance. In some cases, barriers and signs have been posted. The berm walls have been recontoured to reflect the berm design profiles.
Milne Port Site		
12	***Hazardous Waste Containment Facility*** *- During a previous inspection, it was noted that some of the berm crest widths and profiles were not In good shape and there were indications of maneuvering of tracked machinery over the berms.* *-It is suggested that these containments be sign-posted warning of the shallow cover material thickness over the liner limiting traffic movements and caution when placing heavy, sharp, or other large objects which may have the potential to puncture the liner.* *- During the May 2016 inspection this structure was not inspected, INAC will follow up in the next inspection.*	The issue has been brought up by supervisors to their team members. BIMC will continue to monitor the berms to ensure no further disturbance. In some cases, barriers and signs have been posted. The berm walls have been recontoured to reflect the berm design profiles.
Materials Storage:		

13	***Calcium Chloride Storage Area*** *-It is recommended that a perimeter berm / drainage ditch be installed to route runoff away from the storage and down the slope hill to the drainage ditch along the Tote Road as a preventative measure.* *- BIMC has committed to visual monitoring and flow mapping of the area during freshet 2016 and that drainage measures will be implemented where appropriate.* *- During the May 2016 inspection this structure was not inspected, INAC will follow up in the next inspection.*	No runoff or water flow was observed at this location during 2016. BIMC will continue to monitor the area for runoff and will implement drainage measures where required.
Waste Water:		
14	***Accumulated water at the new maintenance building at KM60 on the Tote Road*** *- During a previous inspection, concern was expressed on how BIMC would deal with accumulated wastewater within this facility.* *- BIMC has provided justification that water will not accumulate within this facility or migrate from this facility. BIMC has committed to monitor this structure.*	During 2016, no significant water accumulation was observed within this structure. BIMC will continue to monitor this structure for surface water drainage.

Notes:

[1] Item No. as referenced in AANDC Water Licence Inspection Report May 18-20, 2016

Table A.2 - Baffinland Response to INAC Water Licence Inspection Report, Dated September 13, 2016 (Inspection Dates July 6 to 8)		
ITEM No.[1]	Observation or Item of Concern	Baffinland Responses
Water Management Structures		
1	***Waste Rock Pile Sedimentation Pond*** *- Runoff at the Waste Rock Pile was not being properly diverted to the sedimentation pond* *- BIMC committed to addressing the surface water runoff concern of this facility by July 22, 2016* *- Follow-up will be completed at the next inspection*	The Waste Rock Settling Pond was excluding the ditching, was completed in May 2016. Modifications were made to the ditching and diversion structures throughout the summer to ensure effective direction of surface water drainage. Nuna East was contracted to recontour and modify the water management infrastructure (sedimentation pond, drainage ditching, diversion berms) associated with the waste rock stockpile and pond. These modifications were effective in directing most runoff originating from the waste rock stockpile to the sedimentation pond.
2	***Ore Stockpile Diversion Ditches and Ore Stockpile Settling Ponds at Milne Inlet*** *- A Letter of Non-Compliance was issued regarding the commitments not achieved after the May 2016 Inspection* *- In a response provided to the Inspector prior to this inspection, BIMC has submitted a plan entitled, "Milne Stockpile Pad Water Drainage System – Execution Plan and Schedule" whereas work was planned to be completed by June 22, 2016.* *- Completed work was confirmed to have occurred on this structure during the inspection*	Noted.
3	***Water Management Structures along the Tote Road*** *- Due to the significant sedimentation of waterways around the project, a Letter of Non-Compliance was issued to BIMC to address this issue.* *- In response to the Letter of Non-Compliance, BIMC has made significant progress related to mitigating sedimentation events from project activities.* *- Updates are being provided by BIMC in bi-weekly reports of any new work associated with addressing and mitigating sedimentation of waterways along the Tote Road.* *- On September 30, 2016 a Tote Road and Mine Haul Road mitigation action plan is due to Environment and Climate Change Canada that will provide an implementation schedule addressing sediment water runoff from the road into culverts, ditches, and creeks/streams which leads to David Lake, Mural Lake, Kabikok Lake, KM32 Lake, KM27 Lake, Camp Lake, Sheardown Lake, Mary River, and Phillips Creek.*	On September 29th, 2016, BIMC submitted the Completion Report to Environment and Climate Change Canada and INAC in response to the Fisheries Act Direction and INAC Letter of Non-Compliance. Included in the Completion Report was the Sedimentation Mitigation Action Plan which outlines sedimentation mitigation measures to be taken at the Mary River Project, including the Tote Road and Mine Haul Road. As part of the Sedimentation Mitigation Action Plan, BIMC is currently finalizing a Tote Road Earthworks Execution Plan (TREEP) to address outstanding concerns (culverts, embankment erosion, etc.) along the Tote Road. The TREEP will outline timelines and measurable deliverables and will discuss the planned road upgrades and sedimentation mitigation measures to be completed along the Tote Road in the future.
Culverts/Bridges		
4	***Bridges along Tote Road*** *- In a previous inspection it was noted that road material was being pushed into water courses that are crossed by a bridge.* *- In the report submitted June 24, 2016 BIMC provided documentation that this issue was addressed.*	Noted. Material is not be deliberately pushed into the water, rather material that falls off the trucks and other equipment drops through gaps in the bridge. The issue was addressed in so far as materials that fell on the ice below the bridges were scraped up prior to freshet. The design of each bridge is such that some road material will fall through the gaps, however, the gaps are an integral design feature of the bridges. More study of this design challenge is required. Baffinland will keep you notified of our work in this regard.

5	***Culverts*** *- Previous concerns related to culverts management and maintenance is being addressed in the Tote Road and Mine Haul Road mitigation action plan due September 30, 2016.*	See response to Item 3.
Materials Storage		
6	**Ore Crushing Area and associated Sedimentation Ponds** **a.** *This structure was previously identified by BIMC as encroaching onto a nearby stream.* *- at the time of this inspection, BIMC was conducting work to remove a section of the ore crushing area pad away from the stream.* *- significant erosion and sedimentation control measures were in place during this activity.* ***b.*** *Another concern that was noted in a previous inspection was the drainage of the facility.* *- BIMC has installed culverts and graded the facility to help channel water to the sedimentation pond.*	During early July, the Mine Site Crusher Pad was recontoured to optimize surface water drainage on the pad. Moreover, in accordance with the facility design intent a perimeter ditch was extended around the crusher pad to intercept and redirect runoff to the crusher pad sedimentation pond.
Sites of Concern from Previous Inspections		
Water Management Structures:		
Mine Site		
7	***Jetty at Camp Lake*** *- Silt curtain were installed in July to prevent further damage to the structure.* *- On August 23, 2016 BIMC provided notice that there have been delays in making the required repairs to the jetty due to logistical problems.* *- BIMC has committed to finalizing the work before freeze-up.*	Silt curtains were installed around the perimeter of the Camp Lake Jetty during mid-July. In mid-September, the jetty was repaired and armoured along its perimeter in order to prevent similar erosion events from occurring in the future. All work was completed prior to freeze-up.
8	***Bulk Fuel Storage Facility Containment*** *- The embankment crest and some side slopes were not maintained to the design profile as required.* *- During the July 2016 inspection the berms/embankments appeared to be well maintained.*	Noted.
9	***Hazardous Waste Containment*** *- During a previous inspection, it was noted that the crest width and profiles of some of these facilities near the aerodrome were not in good shape. There were indications of manoeuvring of tracked machinery over the embankment resulting in a disturbed embankment profile. It is recommended these containments receive maintenance.* *- During the July 2016 inspection the berms/embankments appeared to be well maintained.*	Noted.
Milne Port Site		

10	***Hazardous Waste Containment Facility*** *- During a previous inspection, it was noted that some of the berm crest widths and profiles were not in good shape and there were indications or manoeuvring of tracked machinery over the berms.* *- During the May 2016 inspection this structure was not inspected.* *- During the July 2016 inspection it was noted that there was evidence of water within the facility close to overtopping at the spillway. Sufficient freeboard must be maintained at this facility.*	Following the inspection, the contaminated water contained in Hazardous Waste Berm MP-HWB-1 was transferred to the Milne Port Contaminated Snow Storage Berm for treatment. Water contained within the Contaminated Snow Storage Berm was treated using the onsite oily water treatment plant and discharged to the receiving environment during late August 2016. Effluent discharged to the receiving environment met the water quality criteria outlined in the Type A Water Licence (2AM-MRY1325). Prior to freeze-up, Hazardous Waste Berm MP-HWB-1 did not contain pooled water.
11	***Calcium Chloride Storage Area*** - It is recommended that a perimeter berm/drainage ditch be installed to route the runoff away from the storage and down the slope hill to the drainage ditch along the Tote Road as a preventative measure. - BIMC has committed to visual monitoring and flow mapping of the area during Freshet 2016 and that drainage measures will be implemented as appropriate. - This facility was inspected and no concerns were noted.	Very little to no runoff or water flow was observed at this location during 2016. BIMC will continue to monitor the area for runoff and will implement drainage measures where appropriate.

Notes:

[1] Item No. as referenced in AANDC Water Licence Inspection Report July 6 - 8, 2016

Table A.3 - Baffinland Response to INAC Water Licence Report Dated November 9, 2016 (Inspection Dates Sept 28and 29)		
ITEM No.[1]	**Observation or Item of Concern**	**Baffinland Responses**
Water Management Structures		
1	***Waste Rock Pile Sedimentation Pond and Surface Water Management Ditches*** *- BIMC explained that proper diversion ditches for this facility were constructed as noted in a previous inspection.* *- During inspection, snow cover prevented proper inspection of this facility.* *- Follow-up will be conducted when snow melts.*	The Waste Rock Settling Pond was completed in May 2016. Modifications were made to the ditching and diversion structures throughout the summer to ensure effective direction of surface water drainage. Nuna East was contracted to recontour and modify the water management infrastructure (sedimentation pond, drainage ditching, diversion berms) associated with the waste rock stockpile and pond. These modifications were effective in directing most runoff originating from the waste rock stockpile to the sedimentation pond. Monitoring of effectiveness of the ditching will be ongoing.
2	***Crusher Pad Construction*** *- A recent expansion of this facility was completed.* *- It was noted previously that BIMC had installed mitigation measures to address sedimentation during construction.* *- At the time of this inspection, BIMC left the mitigation measures in place to address possible sedimentation during spring melt.*	Noted.
3	***Crusher Pad Sedimentation Pond*** *- Significant snow cover prevented proper inspection of this facility; however, no signs of leaks were apparent.*	Noted.
4	***Ore Stockpile Sedimentation Pond West*** *- During the July 2016 Geotechnical Inspection, it was identified that there is concern over the stability of the liner in this pond.* *- Furthermore, culvert inlet is possibly allowing water to flow under the liner. This must be repaired during the next construction season.*	Tires, serving as ballast, have been placed on the exposed areas of the liner in accordance with the instructions provided by Baffinland's geotechnical consultant. Concerns associated with the liner at the inlet of the West Ore Stockpile Sedimentation Pond will be addressed by May 31, 2017, assuming ground conditions are sufficiently thawed to allow for the keying in of the liner at that time. The work will proceed in accordance with instructions provided by Baffinland's geotechnical inspection engineer. In the interim prior to final repair, contingency measures will be in place to direct the water appropriately.
5	***Ore Stockpile Sedimentation Pond East*** *- At the time of the inspection, the water within the pond was approximately 30 cm from overtopping. It was recommended to BIMC that this pond be decanted to prevent uncontrolled discharge from this facility.*	The water contained in the East Ore Stockpile Sedimentation Pond is currently frozen. The water level in the sedimentation pond will be monitored closely and discharged to the receiving environment during the spring melt in 2017. A pre-discharge sample was taken just prior to freeze-up. The results of the sample met effluent requirements for this location. Discharge from the Ore Stockpile Sedimentation Ponds in Milne Port will meet the water quality criteria outlined in the Type A Licence (2AM-MRY1325).

6	**Hazardous Waste Berms (MS-HWB1 to 6, and MP-HWB-1, MP-HWB-3 to 5)** *- All hazardous waste berms were inspected.* *- All waste was contained within the facility and no signs of leaks were apparent.*	Noted.
7	***Polishing Waste Stabilization Ponds (Three Ponds at Mary River and One Pond at Milne Port)*** *- Significant snow cover prevented a proper inspection; however, no signs of leaks in the berm walls or tears in the liner were apparent.*	Noted.
8	***Ore Stockpile Pad Diversion Ditches*** *- No concerns related to this infrastructure.*	Noted.
9	***Contaminated Snow Containment Facility*** *- Significant snow cover prevented proper inspection of this facility; however, no signs of leaks were apparent.*	Noted.
10	***Landfarm Facility*** *- Significant snow cover prevented proper inspection of this facility; however, no signs of leaks were apparent.*	Noted.
11	***Bulk Fuel Storage Facility at Mine Site, Aerodrome, and Milne Port*** *- No concerns with these structures.*	Noted.
Water Use		
12	*Records for water use were in good order at the time of the inspection at both Milne Port and Mary River Mine Site.*	Noted.
13	*At the time of the inspection, water was primarily being used to support camp functions.*	Noted.
Waste Discharges		
14	*BIMC was discharging sewage waste as intended. No other discharges of wastes were occurring during the inspection.*	Noted.
15	*Records of sewage discharges were in good order.*	Noted.
Erosion and Sedimentation		
16	***General Site Comment*** *- Due to the significant sedimentation of waterways around the Project, a Letter of Non-Compliance was issued to BIMC to address this issue.* *- In response to the Letter of Non-Compliance, BIMC has made significant progress related to mitigating sedimentation events from project activities.* *- On September 30, 2016 a Dust Mitigation Action Plan and a Sedimentation Mitigation Action Plan was submitted by BIMC to address the concerns over Dust and Sedimentation on site.*	Noted. We will endeavor to provide periodic updates on the progress made in the implementation of the Action Plans over the course of the winter.

17	***Jetty at Camp Lake*** *- The construction of this structure was complete at the time of the inspection.* *- Proper sedimentation measures were installed during construction.*	Silt curtains were installed around the perimeter of the Camp Lake Water Jetty during mid-July. In mid-September, the jetty was repaired and armoured along its perimeter in order to prevent similar erosion events from occurring in the future. All work was completed prior to freeze-up.
Culverts/Bridges		
18	***Bridges along Tote Road*** *- In a previous inspection it was noted that road material was being pushed into water courses that are crossed by a bridge.* *- BIMC has developed a plan to minimize the amount of road material entering major water courses.* *- This will be monitored during future inspections.*	Noted.

APPENDIX D.7.5

2016 QIA INSPECTION REPORTS

AND BAFFINLAND REPONSES

ᕿᑭᖅᑖᓂ ᐃᓄᐃᑦ ᑲᑐᔾᔨᖃᑎᒌᖕᒋᑦ
Qikiqtani Inuit Association

July 18, 2016

Mr. Todd Burlingame
Vice President
Sustainable Development
Baffinland Iron Mines Corporation
2275 Upper Middle Road East, Suite 300
Oakville, ON L6H 0C3

Mr. Burlingame,

RE: BAFFINLAND IRON MINES CORPORATION'S, MARY RIVER PROJECT, JUNE 2015 INSPECTION – QIKIQTANI INUIT ASSOCIATION FINDINGS AND RECOMMENDATIONS

This letter is being issued from the Qikiqtani Inuit Association (QIA) to Baffinland Iron Mines Corporation (BIMC) which provides a summary of the findings and recommendations from the QIA's June 2016 Inspection, as per Schedule E, Item 12 of the Commercial Lease No.: Q13C301 (CPL).[1] The Inspection was undertaken from June 24 to June 28, 2016, by ARKTIS Solutions Inc. (ARKTIS) on behalf of the QIA.

In summary, the June 2016 Inspection included the following activities:

- A general site inspection to assess BIMC's compliance with select environmental terms and conditions of any permits, licences, leases or other agreements that are associated with the Project;
- An update on the Tote Road Reconciliation, including the current status of survey and sections upgraded since the September 2015 Environmental Inspection;
- A review of the issues surrounding the KM 97 Borrow Source survey and volume calculation;
- A review of the proposed Q16 Quarry area; and,
- An inspection of BIMC's water management practices and infrastructure, in particular, those items described in Environment and Climate Change Canada's (ECCC) June 7, 2016, letter and Indigenous and Northern Affairs Canada's (INAC) June 16, 2016, notice.

The findings, recommendations, and action items from the June 2016 Inspection are provided in Table 1.

[1] QIA and BIMC (2013) Commercial Lease No. Q13C301. September 6, 2013.

Table 1. Summary of findings, recommendations, and action items from the September 2015 Environmental Inspection.

No.	Description of Concern or Finding	Recommended Action	Timeline	Responsible Party
1	There is windblown waste and rubbish around site following winter.	BIMC to complete site wide housekeeping and tidying.	16/07/31	BIMC
2	Liner from the Milne Port fuel bladder facility still located in the landfarm. The liner has been mostly segregated from the contaminated soils.	As previously agreed, BIMC is to package the liner in a lined sea can for shipment offsite during the 2016 sealift. A lined sea can is located adjacent to the landfarm. BIMC stated that they were unable to load the liner into the sea can in the landfarm, as it has the potential to rupture the liner due to weight; BIMC will use a long-arm excavator to complete the task. If the excavator is not available or can not be used for this purpose, an alternative method to remove the liner shall be developed (which will not rupture the liner) and implemented to meet the 2016 sealift.	16/09/30	BIMC
3	Evidence of free product, 1 mm thick on pooled water, in Hazardous Waste Berm MP-HWB-1.	BIMC to treat free product and contaminated water. BIMC to ensure exteriors of containers are not contaminated when removing these items from the hazardous waste berm.	16/09/21	BIMC

No.	Description of Concern or Finding	Recommended Action	Timeline	Responsible Party
4	Sedimentation in stream at km 74, culvert CV211. Water flowing downhill along old alignment is sediment-bearing. Material stockpiled near downstream side of culvert may also be contributing to sedimentation. Upstream of culvert, the stream has minimal sediment load.	BIMC implemented sediment and erosion control methods within hours of documenting the event. Mitigation includes silt fences and flocculent impregnated jute.	16/06/26 Complete, Ongoing	BIMC
5		BIMC to relocate materials stockpiled near downstream side of culvert.	16/07/08	BIMC
6		BIMC to install rip rap on slopes near CV211 to reduce the potential of future events at this location.	16/07/31	BIMC
7	The landfill fencing is damaged following winter, and minor amounts of windblown waste is located outside the landfill perimeter.	BIMC to repair landfill fencing. BIMC to return waste outside of landfill to landfill.	16/07/31	BIMC
8	Fuel drums outside of containment near the Mine Site refueling station.	BIMC to relocate drums to containment area or use temporary containment beneath drums.	16/07/01 Complete	BIMC
9	Oil tote outside of containment in the southwest corner of the utilities complex.	BIMC to relocate tote to containment area or use temporary containment beneath tote.	16/07/01 Complete	BIMC
10	Drainage from QMR2 access road was redirected into Camp Lake Tributary 1 by breaching the perimeter berm of the access road. The breach in	BIMC to repair breach in berm. BIMC to implement a drainage plan for the QMR2 access road. The drainage plan shall be added as an appendix to the	17/03/31	BIMC

No.	Description of Concern or Finding	Recommended Action	Timeline	Responsible Party
15	Minimal number of drip trays located under the equipment located outside of the Mine Site Maintenance facilities; however, the Inspector is uncertain how long the equipment has been located there.	BIMC to send out notice reminding employees and contractors the importance and proper use of spill trays.	16/07/01 Complete	BIMC
16	Two totes of oil and hydraulic fluid located outside of containment behind Mine Site Toromont Maintenance Shop.	BIMC to relocate totes to containment area or use temporary containment beneath totes.	16/07/01 Complete	BIMC
17	Totes of waste oil and other hazardous material located in front of Mine Site Maintenance Shop. This material is awaiting pickup for transfer to the hazardous waste berms.	BIMC to construct a small hazardous waste berm for temporary storage of the hazardous waste material while awaiting pick-up.	16/07/01 Complete	BIMC
18	Recently constructed drainage ditches for the waste rock stockpile pond were not properly constructed. Ditching is currently redirecting runoff around the waste rock stockpile sedimentation pond. Ditching was intended to capture runoff from the waste rock stockpile while diverting runoff not from the waste rock stockpile (**Error! Reference source not found.** to **Error! Reference source not found.**).	BIMC promptly reconstructed the ditching so that runoff from the waste rock stockpile is collected into the waste rock stockpile pond.	16/06/27 Complete	BIMC

No.	Description of Concern or Finding	Recommended Action	Timeline	Responsible Party
19	Mine Site crusher and ore stockpile pad exceeded the design footprint and impinged on the 31 m buffer area between Project infrastructure and water bodies (Sheardown Lake Tributary) (**Error! Reference source not found.**).	BIMC to re-construct pad to the proposed design criteria ensuring that there is a 31 m buffer area between the Project infrastructure and all water bodies. Ditching will be located on the perimeter of the crusher pad as required by ECCC's Fisheries Act Direction. BIMC will be expanding the crusher pad beyond the current for-construction drawing footprint; the drawings for this expansion are currently being developed.	16/07/17	BIMC
20	The hazardous waste berms at the Project have been subject to continuing spills of waste oil over the past year. Due to the limited capacity of the oily water separator plant (OWSP), and the long period of frozen conditions, it may take the majority of the unfrozen months to clean up these spills.	It is recommended that BIMC review their hazardous waste management policy, to mitigate against spills moving forward.	None	BIMC
21	If untreated water cannot be managed effectively with the current OWSP, improvements to the OWSP (or management of the water) may be required.	It is recommended that BIMC review the current capacity of the OWSP, the current and future demand on the OWSP, and the time required annually for the OWSP to treat the contaminated water on site. BIMC shall provide a report these findings to the QIA.	16/09/21	BIMC

ᑎᑎᖅᑲᒃᑎᕐᒃ 1340, ᐃᖃᓗᐃᑦ, ᓄᓇᕗᑦ X0A 0H0 • ᐅᖄᓚᐅᑦ (867) 979-5391 • ᐊᑭᖏᑦᑐᖅ 1 800-667-2742 • ᓱᑲᔪᖅ (867) 979-3238 • ᖃᕆᓴᐅᔭᖅ qikiqtani.nu.ca

No.	Description of Concern or Finding	Recommended Action	Timeline	Responsible Party
22	In the construction zone from km 77 to km 74, BIMC has used made frequent use of sedimentation and erosion controls. Deposited sediment upstream of these controls demonstrates BIMC's effective employment of the devices.	The sedimentation events in the km 74 to km 77 construction area may be a result of construction activities; however, due to the long, and occasionally steep slopes in this area, it is recommended that all slopes along this section near stream crossings be lined with geosynthetic liner and rip rap to prevent future occurrences. It is recommended that a timeline for completing this task be discussed as part of the Tote Road Management Plan.	16/09/30	BIMC
23	The characteristics of the Tote Road and the stream crossings along the Tote Road change frequently from the Mine Site to Milne Port.	To manage the Tote Road effectively, it is recommended that the Tote Road Management Plan be developed in consideration of these different intervals along the Tote Road. Additionally, it is recommended that the Tote Road Management Plan incorporate maps for each interval, showing high risk sections, what sediment and erosion control is in place, and fish-bearing waterbodies.	16/09/30	BIMC

Re: Response to Findings and Recommendations - QIA June Inspection

Dear Stephen:

During June 24th to June 28th, 2016, Arktis Solutions Inc. conducted an environmental inspection at Baffinland's Mary River Project. During the inspection, several concerns and recommendations were identified and outlined in the QIA letter dated July 18, 2016.

The attached Table A.1 summarizes the findings and recommendations noted by QIA during the June inspection and provides Baffinland's response.

Please do not hesitate to contact us should you have any further comments or questions.

Sincerely,

James Millard
Environmental Manager

Todd Burlingame, Wayne McPhee (Baffinland)

Table A.1 - Baffinland Response to QIA Letter, dated July 18, 2016 (Inspection date June 24-28)

No.	Description of QIA Inspector's Concern or Finding	QIA Recommended Action	Item Status	BIM Response
1	There is windblown waste and rubbish around site following winter.	BIMC to complete site wide housekeeping and tidying.	Completed	Throughout the summer months, each department initiated the clean-up and organization of their respective work areas. Windblown waste and debris left over from the spring melt was collected, segregated and disposed of according to the Baffinland Waste Management Plan. Baffinland will continue to initiate and encourage site wide housekeeping and clean-up events in the future. In addition, the Environment department will continue conduct routine inspections and audits to ensure departments are adhering to the Waste Management Plan.
2	Liner from the Milne Port fuel bladder facility still located in the landfarm. The liner has been mostly segregated from the contaminated soils.	As previously agreed, BIMC is to package the liner in a lined sea can for shipment offsite during the 2016 sealift. A lined sea can is located adjacent to the landfarm. BIMC stated that they were unable to load the liner into the sea can in the landfarm, as it has the potential to rupture the liner due to weight; BIMC will use a long-arm excavator to complete the task. If the excavator is not available or can not be used for this purpose, an alternative method to remove the liner shall be developed (which will not rupture the liner) and implemented to meet the 2016 sealift.	Completed	Most of the accessible HDPE liner was removed from the Milne Port landfarm prior to September 30, 2016, and stored in lined seacans for shipment off site during the 2017 sealift. Following the 2017 spring melt, the landfarm will be operated in accordance with the approved Baffinland *Landfarm Operation, Maintenance and Monitoring Manual*.
3	Evidence of free product, 1 mm thick on pooled water, in Hazardous Waste Berm MP-HWB-1.	BIMC to treat free product and contaminated water. BIMC to ensure exteriors of containers are not contaminated when removing these items from the hazardous waste berm.	Completed	Contaminated water contained in Hazardous Waste Berm MP-HWB-1 was transported to the Milne Port Contaminated Snow Storage Facility for treatment. Impacted water contained within the Contaminated Snow Storage Facility was treated using the onsite oily water treatment plant and discharged to the receiving environment during late August 2016. The discharged effluent discharged met the water quality criteria outlined in the Type A Water Licence (2AM-MRY1325).
4	Sedimentation in stream at km 74, culvert CV211. Water flowing downhill along old alignment is sediment-bearing. Material stockpiled near downstream side of culvert may also be contributing to sedimentation. Upstream of culvert, the stream has minimal sediment load.	BIMC implemented sediment and erosion control methods within hours of documenting the event. Mitigation includes silt fences and flocculent impregnated jute.	Completed	Noted.
		BIMC to relocate materials stockpiled near downstream side of culvert.	Completed	The materials stockpiled downstream of CV211 were removed in late June.
		BIMC to install rip rap on slopes near CV211 to reduce the potential of future events at this location.	1-May-17	Rip rap (aggregate) has yet to be installed along the slopes and drainage routes near CV211. Rip rap will be installed along the slopes near CV211 by June 1, 2017.
7	The landfill fencing is damaged following winter, and minor amounts of windblown waste is located outside the landfill perimeter.	BIMC to repair landfill fencing. BIMC to return waste outside of landfill to landfill.	Completed	A small quantity of windblown landfill waste outside of the perimeter fence was collected and redeposited back to the landfill in June 2016. The existing fence was temporarily repaired. A new perimeter fence was installed around the open face of the landfill during September 2016. The fence is positioned around the northern perimeter of the landfill and has so far proven effective in capturing windblown waste originating from the landfill.
8	Fuel drums outside of containment near the Mine Site refueling station.	BIMC to relocate drums to containment area or use temporary containment beneath drums.	Completed	The fuel drums were placed within secondary containment (spill tray).
9	Oil tote outside of containment in the southwest corner of the utilities complex.	BIMC to relocate tote to containment area or use temporary containment beneath tote.	Completed	The oil tote has been placed within secondary containment (spill tray).
10	Drainage from QMR2 access road was redirected into Camp Lake Tributary 1 by breaching the perimeter berm of the access road. The breach in the berm was unauthorized by the environmental department. The breach contributed to sedimentation events in the Camp Lake Tributary 1 as evidenced by the deployment of sediment and erosion control and deposited sediments.	BIMC to repair breach in berm. BIMC to implement a drainage plan for the QMR2 access road. The drainage plan shall be added as an appendix to the QMR2 Quarry Management Plan, and submitted with the 2016 Annual Report.	1-May-17	Baffinland will repair the breach in the berm prior to freshet 2017 and reconfigure the drainage so as to not impact the nearby streams. Consideration will be given to adding a drainage plan for the QMR2 access road to the existing QMR2 Quarry Management Plan.
11	Fuel drum located on top of the aerodrome fuel berm.	BIMC to relocate drum to containment area or use temporary containment beneath drum.	Completed	The fuel drum has been placed inside the Aerodrome fuel berm.

Table A.1 - Baffinland Response to QIA Letter, dated July 18, 2016 (Inspection date June 24-28)

No.	Description of QIA Inspector's Concern or Finding	QIA Recommended Action	Item Status	BIM Response
12	Free product, 1 mm thick, floating on surface of water in the Mine Site fuel bladder farm.	BIMC to treat free product and contaminated water. BIMC to ensure exteriors of containers are not contaminated when removing these items from the hazardous waste berm.	Completed	Water contained within the former Mine Site fuel bladder farm (MS-HWB-7) berm was treated using the onsite oily water treatment plant and discharged to the receiving environment prior to freeze-up. The effluent discharged to the receiving environment met the water quality criteria outlined in the Type A Water Licence (2AM-MRY1325). In addition, Baffinland will inspect the exterior of containers for contamination prior to removing drums or totes from storage berms.
13	Free product, 1 mm thick, floating on surface of water in Hazardous Waste Berm HWB-MS-4.	BIMC to treat free product and contaminated water. BIMC to ensure exteriors of containers are not contaminated when removing these items from the hazardous waste berm.	Completed	Water contained within the Mine Site Hazardous Waste Berm MS-HWB-4 was treated using the onsite oily water treatment plant and discharged to the receiving environment prior to freeze-up. The effluent discharged to the receiving environment met the water quality criteria outlined in the Type A Water Licence (2AM-MRY1325). In addition, Baffinland will inspect the exterior of containers for contamination prior to removing drums or totes from storage berms.
14	Water has been relocated to the Mine Site fuel bladder farm for treatment, however, evidence of free product in Hazardous Waste Berm HWB-MS-3 sediments.	BIMC to ensure exteriors of containers are not contaminated when removing these items from the hazardous waste berm.	Completed	Baffinland will continue to inspect the exterior of containers for contamination prior to removing drums or totes from storage berms.
15	Minimal number of drip trays located under the equipment located outside of the Mine Site Maintenance facilities; however, the Inspector is uncertain how long the equipment has been located there.	BIMC to send out notice reminding employees and contractors the importance and proper use of spill trays.	Completed	Baffinland will continue to enforce the use of the spill trays under vehicles that are being parked for extended periods of time in accordance with Baffinland's Spill Tray Guideline. The Environment department will continue to send out reminders to employees stressing the importance of the use of the spill trays and compliance with this practice will be a component of routine environmental inspections conducted by the Environment Department.
16	Two totes of oil and hydraulic fluid located outside of containment behind Mine Site Toromont Maintenance Shop.	BIMC to relocate totes to containment area or use temporary containment beneath totes.	Completed	The two totes were relocated inside the Toromont Maintenance building and were placed into secondary containment (spill tray).
17	Totes of waste oil and other hazardous material located in front of Mine Site Maintenance Shop. This material is awaiting pickup for transfer to the hazardous waste berms.	BIMC to construct a small hazardous waste berm for temporary storage of the hazardous waste material while awaiting pick-up.	In Progress	The noted hazardous wastes outside of the Mobile Maintenance Shop have been transferred to the hazardous waste berms. Consideration is presently being given to fabricating a small berm for temporary hazardous waste storage outside of the Mobile Maintenance Shop.
18	Recently constructed drainage ditches for the waste rock stockpile pond were not properly constructed. Ditching is currently redirecting runoff around the waste rock stockpile sedimentation pond. Ditching was intended to capture runoff from the waste rock stockpile while diverting runoff not from the waste rock stockpile.	BIMC promptly reconstructed the ditching so that runoff from the waste rock stockpile is collected into the waste rock stockpile pond.	Completed	The Waste Rock Settling Pond was completed in May 2016. Modifications were made to the ditching and diversion structures throughout the summer to ensure effective direction of surface water drainage. Nuna East was contracted to recontour and modify the water management infrastructure (sedimentation pond, drainage ditching, diversion berms) associated with the waste rock stockpile and pond. These modifications were effective in directing most runoff originating from the waste rock stockpile to the sedimentation pond.
19	Mine Site crusher and ore stockpile pad exceeded the design footprint and impinged on the 31 m buffer area between Project infrastructure and water bodies (Sheardown Lake Tributary).	BIMC to re-construct pad to the proposed design criteria ensuring that there is a 31 m buffer area between the Project infrastructure and all water bodies. Ditching will be located on the perimeter of the crusher pad as required by ECCC's Fisheries Act Direction. BIMC will be expanding the crusher pad beyond the current for-construction drawing footprint; the drawings for this expansion are currently being developed.	Completed	During early July , the limits of the crusher pad were modified to allow for a 31 m buffer area between the crusher pad and nearby water bodies. Moreover, in accordance with the facility design intent, a perimeter ditch was completed around the crusher pad to redirect runoff to the crusher pad sedimentation pond. The construction drawings for the crusher pad expansion were submitted to QIA and others on September 29th as part of Fisheries Act Direction Completion Report.
20	The hazardous waste berms at the Project have been subject to continuing spills of waste oil over the past year. Due to the limited capacity of the oily water separator plant (OWSP), and the long period of frozen conditions, it may take the majority of the unfrozen months to clean up these spills.	It is recommended that BIMC review their hazardous waste management policy, to mitigate against spills moving forward.	Ongoing	Agreed, Baffinland agrees that a periodic reviews of hazardous waste and waste management are useful undertakings.

Table A.1 - Baffinland Response to QIA Letter, dated July 18, 2016 (Inspection date June 24-28)

No.	Description of QIA Inspector's Concern or Finding	QIA Recommended Action	Item Status	BIM Response
21	If untreated water cannot be managed effectively with the current OWSP, improvements to the OWSP (or management of the water) may be required.	It is recommended that BIMC review the current capacity of the OWSP, the current and future demand on the OWSP, and the time required annually for the OWSP to treat the contaminated water on site. BIMC shall provide a report of these findings to the QIA.	In Progress	To date, Baffinland has been able to effectively treat the volume of oily water using existing treatment facilities. The volume of oily water requiring treatment is safely stored in engineered lined facilities. Baffinland reviews storage and treatment capacity of its facilities on a periodic basis. Consideration is currently being giving to acquire additional equipment to increase the onsite capacity for hydrocarbon contaminated water treatment. In future, Baffinland will endeavor to update QIA and others on the status of this initiative.
22	In the construction zone from km 77 to km 74, BIMC has used and made frequent use of sedimentation and erosion controls. Deposited sediment upstream of these controls demonstrates BIMC's effective employment of the devices.	The sedimentation events in the km 74 to km 77 construction area may be a result of construction activities; however, due to the long, and occasionally steep slopes in this area, it is recommended that all slopes along this section near stream crossings be lined with geosynthetic liner and rip rap to prevent future occurrences. It is recommended that a timeline for completing this task be discussed as part of the Tote Road Management Plan.	In Progress	This area will be assessed for the requirement of further work such as the installation of geotextile and rip rap. The Tote Road Earthworks Execution Plan (TREEP) will be completed in February 2017 and will provide the scope and timeline for this work, if warranted. The TREEP will help to inform the contents of a revised Roads Management Plan.
23	The characteristics of the Tote Road and the stream crossings along the Tote Road change frequently from the Mine Site to Milne Port.	To manage the Tote Road effectively, it is recommended that the Tote Road Management Plan be developed in consideration of these different intervals along the Tote Road. Additionally, it is recommended that the Tote Road Management Plan incorporate maps for each interval, showing high risk sections, what sediment and erosion control is in place, and fish-bearing waterbodies.	In Progress	The existing Roads Management Plan (the Plan) will be revised to include a section focused on environmental protection measures and controls used along the Tote Road based on recognized environmental risks. The Snow Management Plan and initiatives outlined in the Tote Road Earthworks Execution Plan (TREEP), will also be included. The revised Roads Management Plan will be submitted to QIA and others by March 31, 2017. In the meantime, Baffinland may reach out to QIA and others to discuss some of the details of this plan prior to final submission.

Oakville, ON L6H 0C3

Mr. Burlingame,

RE: BAFFINLAND IRON MINES CORPORATION'S, MARY RIVER PROJECT, AUGUST 2016 INSPECTION – QIKIQTANI INUIT ASSOCIATION FINDINGS AND RECOMMENDATIONS

This letter is being issued from the Qikiqtani Inuit Association (QIA) to Baffinland Iron Mines Corporation (BIMC) which provides a summary of the findings and recommendations from the QIA's August 2016 Inspection, as per Schedule E, Item 12 of the Commercial Lease No.: Q13C301 (CPL).[1] The Inspection was undertaken from August 12 to 16, 2016, by ARKTIS Solutions Inc. (ARKTIS) on behalf of the QIA.

In summary, the August 2016 Inspection included the following activities:

- A general site inspection, with focus on the Tote Road, to assess BIMC's compliance with select environmental terms and conditions of any permits, licences, leases or other agreements that are associated with the Project;
- Assess the current status of construction and upgrades along the Tote Road; and,
- Interview with BIMC Environmental Manager to understand the monitoring and reporting activities associated with water crossings on the Tote Road during the construction and operation phases.

The findings, recommendations, and action items from the June 2016 Inspection are provided in Table 1.

Table 1. Summary of findings, recommendations, and action items from the August 2016 Environmental Inspection.

Item No.	Concern Identified	Recommendation
1.	The water level in the East Sedimentation Pond, at Milne Ore Stock Pile Facility, is near the freeboard limit. Based on GPS readings, current freeboard is approximately 1 m. BIMC stated that the water quality in the pond was being sampled the day of inspection for comparison with effluent quality limits and that the freeboard requirement in the issued for construction drawings is 0.3 m. There is no freeboard requirement listed in the water licence.	**Recommendation 1:** If water in the pond meets the water quality criteria, it is recommended that the water be discharged before the freeboard limit is reached. If the water quality is not acceptable, it is recommended to relocate the water to an alternate approved containment facility, to ensure freeboard is not exceeded. During the Inspection, BIMC collected a water sample from this pond and agrees that if it is within licence limits for water quality criteria, discharge of water from the pond is to occur.
2.	The Milne landfarm contains waste debris including a HDPE liner (from the former bladder facility) mixed in with hydrocarbon contaminated soil. The waste debris and HDPE liner are a primary reason why the landfarm is currently not operational.	**Recommendation 2:** It is recommended that all debris, including the HDPE liner be removed and only design approved material be placed in the landfarm to allow for its operation, to treat hydrocarbon contaminated soil. This recommendation was also noted in previous 2015 and 2016 Environmental Inspections[2,3] during which BIMC agreed the activity would be completed by September 30, 2016.

[2] Qikiqtani Inuit Association November 2, 2015 letter to BIMC titled "Baffinland Iron Mines Corporation's, Mary River Project, June and July 2015 Inspections – Qikiqtani Inuit Association Findings and Recommendations".
[3] Qikiqtani Inuit Association July 18, 2016 letter to BIMC titled "Baffinland Iron Mines Corporation's, Mary River Project, June 2016 inspection – Qikiqtani Inuit Association Finding and Recommendations".

ᑎᑎᖅᑲᐅᑎᖓ 1340, ᐃᖃᓗᐃᑦ, ᓄᓇᕗᑦ X0A 0H0 • ᐅᖄᓚᐅᑦ (867) 979-5391 • ᐊᑭᖃᕐᑐᖅ 1 800-667-2742 • ᓱᑲᑦᑐᖅ (867) 979-3238 • ᖃᕋᓴᐅᔭᒃᑯᑦ qikiqtani.nu.ca
P.O. Box 1340, Iqaluit, Nunavut, X0A 0H0 • Phone: (867) 979-5391 • Toll Free 1 800-667-2742 • Fax: (867) 979-3238 • Website: qikiqtani.nu.ca

Item No.	Concern Identified	Recommendation
		During the Inspection, BIMC agreed the landfarm cannot operate with the debris in the containment cell. The deadline of September 30, 2016 remains.
3.	Specified Substances have been stockpiled along KM 3 and 4 of the Tote Road. Additionally, screening of the quarried material has recently occurred at a location near KM 3.5. Stockpiling and processing of Specified Substances is an activity that is planned for the quarry site and managed under the Quarry Management Plan. This is not an approved activity along the Tote Road, which may have negative environmental impacts. For example, the quarry site monitors the surface run off water quality; however, this is not necessarily occurring at the Tote Road stockpiles.	**Recommendation 3:** If water is present, it is recommended that water quality downgradient of the stockpiled Specified Substances and screener location be monitored for potential impacts to the receiving environment. Parameters to monitor shall be the same as that applied to the quarry run off waters. Testing shall be at a frequency as applied to the quarry run off waters and defined in the water licence. If water quality monitoring results in unacceptable quality, corrective action shall be implemented immediately to reduce the water quality in the downstream. During the Inspection, BIMC agreed to complete water quality testing in this area.
4.	The perimeter fence for the Mary River landfill has been removed. A perimeter fence can be an effective method to manage windblown debris.	**Recommendation 4:** It is recommended that a perimeter fence to mitigate against windblown debris entering the receiving environment be reinstalled. This item was also identified during the June 2016 inspection[Error! Bookmark not defined.]. During the Inspection, BIMC agreed that a fence is effective in mitigating against windblown waste and this is noted in their management plans. Current planning is to have a fence installed in the 2016 season.

P.O. Box 1340, Iqaluit, Nunavut, X0A 0H0 • Phone: (867) 979-5391 • Toll Free 1 800-667-2742 • Fax: (867) 979-3238 • Website: qikiqtani.nu.ca

Item No.	Concern Identified	Recommendation
5.	The recent fuel spill at Milne is in the process of being remediated. There will be a large volume of contaminated water that will require treatment prior to discharge (estimates are >70,000 m^3 of contaminated water). The contaminated water will be partially stored in new fuel bladders that will be positioned within the Milne fuel storage facility. The residual contamination in the fuel facility will likely result in additional contaminated water in the future and will require regular management. The current means available on site to treat hydrocarbon contaminated water has a treatment capacity of 50 to 70 m^3/day (dependent on influence concentration). Thus, there may be limited water treatment capacity to manage hydrocarbon contaminated water at site.	**Recommendation 5a:** BIMC complete a needs assessment to increase the capacity for hydrocarbon contaminated water treatment. This item was also identified during the June 2016 inspection**Error! Bookmark not defined.**. BIMC notes that the management of the contact water from the recent spill may need to be addressed independent from the current on-site treatment system. The details of the spill clean-up are not yet finalized at the current time. BIMC is of the opinion that the current treatment capacity available at site is sufficient to meet operational needs. **Recommendation 5b:** The use of fuel bladders at the Mary River project has been identified as environmental concern by QIA in the past. BIMC is reminded that the QIA do not accept the use of fuel bladders as an approved means for fuel storage. It is acknowledged that BIMC use of the fuel bladders in responding to this spill is only for the temporary storage of contact water. This practice is acceptable to QIA however must only be use for short-term temporary storage (not more than one-year).
6.	Based on a review of select management plans and responses from BIMC environmental staff, the QIA has formed the following opinions: i. The timing for the complete construction of the road is not well understood.	**Recommendation 6a:** In addition to the recommendation for the Tote Road Management Plan content provided to BIMC on August 1, 2016[5], the following items are recommended to be included within the Tote Road Management Plan:

[5] Qikiqtani Inuit Association August 1, 2016 letter to Baffinland Iron Mines Corporation titled "Tote Road Management Plan – Preliminary Report Content".

ᑎᑎᖅᑲᑎᒃ 1340, ᐃᖃᓗᐃᑦ, ᓄᓇᕗᑦ X0A 0H0 • ᐅᖄᓚᐅᑦ (867) 979-5391 • ᐊᑭᖃᙱᑦᑐᒃᑯᑦ 1 800-667-2742 • ᓱᑲᑦᑐᒃᑯᑦ (867) 979-3238 • ᖃᕆᑕᐅᔭᒃᑯᑦ qikiqtani.nu.ca
P.O. Box 1340, Iqaluit, Nunavut, X0A 0H0 • Phone: (867) 979-5391 • Toll Free 1 800-667-2742 • Fax: (867) 979-3238 • Website: qikiqtani.nu.ca

Item No.	Concern Identified	Recommendation
	ii. Operations of the road are occurring prior to complete construction of the road. iii. There are road construction upgrades that are not in accordance with the issued for construction drawings, and modifications have been completed during construction to address safety and operational efficiency. iv. There is uncertainty on the expected as-built information to be reported by BIMC. The timing for reporting as-built information is also not well understood. v. The water quality criteria to apply to water crossings during construction, operation and closure phases are uncertain. vi. The locations for water quality monitoring appear to be mainly associated with water crossings that may have a potential impact on fish. Monitoring of water crossings, or other water bodies potentially impacted by the Tote Road, may not be captured within the current monitoring program. There are potential implications regarding the assessment of changes to water quality, as needed to evaluate impacts as per the Water Compensation Agreement[4]. vii. There is a need to have a response action framework to document the decision process on when to implement sediment and erosion control measures, and dust control measures, to mitigate against potential impacts to water.	i. The process BIMC is to follow to complete a modification of the Tote Road design during construction. A modification may be related, but not limited to: realignment, cut and fill, or change to a water crossing. ii. Outline the expected Tote Road, and associated infrastructure, as-built information that will be reported to QIA. iii. Outline the anticipated construction, operation and closure phase timelines. iv. Outline the water quality monitoring locations, frequency and parameters to test for each of the following phases: construction, operation and closure. Monitoring is to address, but not be limited to: water crossing locations; adjacent water bodies; abandoned road sections; effects from dust accumulation; and subsequent drainage to water. v. Water quality criteria during the construction, operations and closure phases of the project. vi. Document the response action framework to limit potential impact to water from sedimentation and erosion onto waters. vii. Document the response action framework to limit potential impacts to water from dust. viii. Pertinent management outcomes from the work being completed to address the ECCC directive. **Recommendation 6b:** Yearly as-built information for the Tote Road be submitted to QIA within the Annual Report.

[4] Qikiqtani Inuit Association and Baffinland Iron Mines Corporation (2013). Water Compensation Agreement. Signed May 3, 2013.

Re: Response to Findings and Recommendations - QIA August Inspection

Dear Stephen:

During August 12th to August 16th, 2016, Arktis Solutions Inc. conducted an environmental inspection at Baffinland's Mary River Project. During the inspection, several concerns and recommendations were identified and outlined in the QIA letter dated August 25, 2016.

The attached Table A.1 summarizes the findings and recommendations noted by QIA during the August inspection and provides Baffinland's response.

Please do not hesitate to contact us should you have any further comments or questions.

Sincerely,

James Millard
Environmental Manager

Table A.1 - Baffinland Response to QIA Letter, dated August 25, 2016 (Inspection Date August 12-16)

No.	Description QIA Inspector's Concern or Finding	QIA Recommended Action	Item Status	BIM Response
1	The water level in the East Sedimentation Pond, at Milne Ore Stock Pile Facility, is near the freeboard limit. Based on GPS readings, current freeboard is approximately 1 m. BIMC stated that the water quality in the pond was being sampled the day of inspection for comparison with effluent quality limits and that the freeboard requirement in the issued for construction drawings is 0.3 m. There is no freeboard requirement listed in the water licence.	Recommendation 1: If water in the pond meets the water quality criteria, it is recommended that the water be discharged before the freeboard limit is reached. If the water quality is not acceptable, it is recommended to relocate the water to an alternate approved containment facility, to ensure freeboard is not exceeded. During the Inspection, BIMC collected a water sample from this pond and agrees that if it is within licence limits for water quality criteria, discharge of water from the pond is to occur.	Ongoing	The recommendation provided by QIA is standard practice for operations of Baffinland's sedimentation ponds. The recommended minimum freeboard for the operation of the Milne Ore Stockpile Sedimentation Ponds is 0.3 m, based on the design engineer's recommendation. The water quality and freeboard in the ponds are and will be monitored closely. The ponds were discharged periodically throughout the summer period in accordance with the applicable terms, conditions, and effluent criteria outlined in Type A Water Licence (2AM-MRY1325).
2	The Milne landfarm contains waste debris including a HDPE liner (from the former bladder facility) mixed in with hydrocarbon contaminated soil. The waste debris and HDPE liner are a primary reason why the landfarm is currently not operational.	Recommendation 2: It is recommended that all debris, including the HDPE liner be removed and only design approved material be placed in the landfarm to allow for its operation, to treat hydrocarbon contaminated soil. This recommendation was also noted in previous 2015 and 2016 Environmental Inspections [2,3] during which BIMC agreed the activity would be completed by September 30, 2016. During the Inspection, BIMC agreed the landfarm cannot operate with the debris in the containment cell. The deadline of September 30, 2016 remains.	Ongoing	Most of the accessible HDPE liner was removed from the Milne Port landfarm prior to September 30, 2016, and stored in lined seacans for shipment off site during the 2017 sealift. Other types of waste debris were also removed and properly sorted and disposed. Some oversize aggregate remains to be removed and this will be completed prior to May 31, 2017. During summer 2017, the landfarm will be operated in accordance with the approved Baffinland Landfarm Operation, Maintenance and Monitoring Manual.
3	Specified Substances have been stockpiled along KM 3 and 4 of the Tote Road. Additionally, screening of the quarried material has recently occurred at a location near KM 3.5. Stockpiling and processing of Specified Substances is an activity that is planned for the quarry site and managed under the Quarry Management Plan. This is not an approved activity along the Tote Road, which may have negative environmental impacts. For example, the quarry site monitors the surface run off water quality; however, this is not necessarily occurring at the Tote Road stockpiles.	Recommendation 3: If water is present, it is recommended that water quality downgradient of the stockpiled Specified Substances and screener location be monitored for potential impacts to the receiving environment. Parameters to monitor shall be the same as that applied to the quarry run off waters. Testing shall be at a frequency as applied to the quarry run off waters and defined in the water licence. If water quality monitoring results in unacceptable quality, corrective action shall be implemented immediately to reduce the water quality in the downstream. During the Inspection, BIMC agreed to complete water quality testing in this area.	Ongoing	Runoff or water flow was not observed downgradient of the crushing/screening activity at km 3.5 during the weekly water sampling events which occurred on August 22, August 29 and September 5. Because of this, no water quality monitoring location has been established at this time. During the spring and summer of 2017, BIMC will continue to monitor for runoff and water flow downgradient of the crushing/screening activity at km 3.5.
4	The perimeter fence for the Mary River landfill has been removed. A perimeter fence can be an effective method to manage windblown debris.	Recommendation 4: It is recommended that a perimeter fence to mitigate against windblown debris entering the receiving environment be reinstalled. This item was also identified during the June 2016 inspection. During the Inspection, BIMC agreed that a fence is effective in mitigating against windblown waste and this is noted in their management plans. Current planning is to have a fence installed in the 2016 season.	Completed	The old fence was removed during landfill berm extension activities. A new perimeter fence was installed around the open face of the landfill during September 2016. The fence is positioned around the northern perimeter of the landfill and has proven effective in capturing windblown waste originating from the landfill. Wind blown waste captured by the fence is routinely removed and redeposited back in the landfill.

Table A.1 - Baffinland Response to QIA Letter, dated August 25, 2016 (Inspection Date August 12-16)

No.	Description QIA Inspector's Concern or Finding	QIA Recommended Action	Item Status	BIM Response
5	The recent fuel spill at Milne is in the process of being remediated. There will be a large volume of contaminated water that will require treatment prior to discharge (estimates are >70,000 m3 of contaminated water). The contaminated water will be partially stored in new fuel bladders that will be positioned within the Milne fuel storage facility. The residual contamination in the fuel facility will likely result in additional contaminated water in the future and will require regular management. The current means available on site to treat hydrocarbon contaminated water has a treatment capacity of 50 to 70 m3/day (dependent on influence concentration). Thus, there may be limited water treatment capacity to manage hydrocarbon contaminated water at site.	Recommendation 5a: BIMC complete a needs assessment to increase the capacity for hydrocarbon contaminated water treatment. This item was also identified during the June 2016 inspection BIMC notes that the management of the contact water from the recent spill may need to be addressed independent from the current on-site treatment system. The details of the spill clean-up are not yet finalized at the current time. BIMC is of the opinion that the current treatment capacity available at site is sufficient to meet operational needs. Recommendation 5b: The use of fuel bladders at the Mary River project has been identified as environmental concern by QIA in the past. BIMC is reminded that the QIA do not accept the use of fuel bladders as an approved means for fuel storage. It is acknowledged that BIMC use of the fuel bladders in responding to this spill is only for the temporary storage of contact water. This practice is acceptable to QIA however must only be use for short-term temporary storage (not more than one-year).	Ongoing	To date, Baffinland has been able to effectively treat the volume of oily water using the existing treatment plant. The volume of oily water requiring treatment is safely stored in engineered lined facilities. Baffinland reviews storage and treatment capacity of its facilities on a periodic basis. Consideration is currently being given to acquiring additional equipment to increase the onsite capacity for hydrocarbon contaminated water treatment, specifically to deal with the recent spill referenced in QIA's comments. In future, Baffinland will endeavor to update QIA and others on the status of this initiative. Baffinland is currently utilizing fuel bladders as short term storage for hydrocarbon residuals and contaminated water associated with the fuel spill and has no plans to use the bladders to store fuel for the longer term. The fuel bladders currently are situated within the secondary containment (berm) of the Milne Port Tank Farm Facility.
6	Based on a review of select management plans and responses from BIMC environmental staff, the QIA has formed the following opinions: i. The timing for the complete construction of the road is not well understood. ii. Operations of the road are occurring prior to complete construction of the road. iii. There are road construction upgrades that are not in accordance with the issued for construction drawings, and modifications have been completed during construction to address safety and operational efficiency. iv. There is uncertainty on the expected as-built information to be reported by BIMC. The timing for reporting as-built information is also not well understood. v. The water quality criteria to apply to water crossings during construction, operation and closure phases are uncertain. vi. The locations for water quality monitoring appear to be mainly associated with water crossings that may have a potential impact on fish. Monitoring of water crossings, or other water bodies potentially impacted by the Tote Road, may not be captured within the current monitoring program. There are potential implications regarding the assessment of changes to water quality, as needed to evaluate impacts as per the Water Compensation Agreement[4]. vii. There is a need to have a response action framework to document the decision process on when to implement sediment and erosion control measures, and dust control measures, to mitigate against potential impacts to water.	Recommendation 6a: In addition to the recommendation for the Tote Road Management Plan content provided to BIMC on August 1, 2016 5, the following items are recommended to be included within the Tote Road Management Plan: i. The process BIMC is to follow to complete a modification of the Tote Road design during construction. A modification may be related, but not limited to: realignment, cut and fill, or change to a water crossing. ii. Outline the expected Tote Road, and associated infrastructure, as-built information that will be reported to QIA. iii. Outline the anticipated construction, operation and closure phase timelines. iv. Outline the water quality monitoring locations, frequency and parameters to test for each of the following phases: construction, operation and closure. Monitoring is to address, but not be limited to: water crossing locations; adjacent water bodies; abandoned road sections; effects from dust accumulation; and subsequent drainage to water. v. Water quality criteria during the construction, operations and closure phases of the project. vi. Document the response action framework to limit potential impact to water from sedimentation and erosion onto waters. vii. Document the response action framework to limit potential impacts to water from dust. viii. Pertinent management outcomes from the work being completed to address the ECCC directive. Recommendation 6b: Yearly as-built information for the Tote Road be submitted to QIA within the Annual Report.	Ongoing	Baffinland is currently considering the various recommendations provided in the August 1 letter as well as the items provided in the August 25, 2016, inspection report. We look forward to more fully responding to QIA on those items that directly relate to the Commercial Lease, e.g., Recommendation 6a (i., ii., iii) and 6b. The Roads Management Plan will be revised and submitted to QIA and others by March 31, 2017. This revised document will address these recommendations. With regard to water quality concerns and monitoring along the Tote Road, Baffinland continues to work with EC, INAC, DFO, as well as QIA on water quality and crossing issues and concerns. The development and implementation of the Sedimentation and Dust Mitigation Action Plans are examples of Baffinland's efforts and work in this regard.

APPENDIX D.7.6
2016 WSCC INSPECTION REPORTS
AND BAFFINLAND RESPONSES

WSCC Workers' Safety & Compensation Commission | ᐃᖅᑲᓇᐃᔭᖅᑎᓄᑦ ᐊᑦᑕᓇᖅᑐᓂᒃ ᐊᒻᒪ ᓇᓪᓕᐅᒃᑯᒪᓂᒃ ᖃᐅᔨᓴᖅᑎᑦ

email Bernard.Laflamme@baffinland.com

Bernard Laflamme
Chief Operating Officer
Baffinland Iron Mines Corporation
2275 Upper Middle Road East - Suite 300
Oakville ON L6H 0C3

Dear Mr. Laflamme:

Further to the **Mine Health and Safety Act article 26** attached is my 20160129 Mary River project inspection report.

As per **MHSA article**

28. please post a copy of this inspection report in a conspicuous location, and

29. advise the chief inspector within 30 days of the remedial measures taken and the remedial measures still to be taken in respect of the inspection report.

32.(1) A person who is adversely affected by a decision or order issued by an inspector may appeal the decision or order, in writing, to the chief inspector within 30 days after its issue.

The WSCC is committed to service excellence. If you have any questions or concerns about this inspection report, please feel free to contact my supervisor Fred Bailey or myself. His phone number is 867 669 4430 or email fred.bailey@wscc.nt.ca.

Sincerely
Workers' Safety and Compensation Commission of the NWT and NU Mine Safety

Martin van Rooy
Engineer/Mines Inspector

cc OHSC c/o tony.noseworthy@baffinland.com

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Mine:	Mary River project	Location:	~950 km NW of Iqaluit	
Operator:	Baffinland Iron Mines Corp.	Lat. 71-19'N		Long. 79-24'W
Manager:	Bernard Laflamme	Inspection Date:		20160114 to 19
Address	2275 Upper Middle Road East - Suite 300 Oakville ON L6H 0C3			

Fred Bailey (chief inspector of mines) and Martin van Rooy (engineer/mine inspector) conducted a general safety inspection of Baffinland's Milne Inlet site, Tote Road and Mary River site. Baffinland's response to WSCC's safe advantage program was audited.

At Milne Inlet the ore storage pad, site services shop, welding shop, Toromont's shop, Maintenance shop, site services garage, incinerator building, ERT building, sewage treatment plant, water treatment plant, Fountain tire's shop and warehouse were checked.

At Mary River the ERT building, welding shop, maintenance shop, truck wash building, Toromont shop, crushing plants C and B, Winterhaven camp, incinerator building, site services garage, warehouse, vehicle fuel station, component rebuild shop, power plant electrical switch rooms 1 and 2 and E-house #1 at camp were checked.

Robert Bateman, Keith Butt, Thane Champion, Tess Daoust, Darryl Finlay, Roland Hardy, Jerry Hodnett, Matthew Johnson, Nuyalea Kipanik, Robert Lanyon, Quency Lewis, Noel O'Brian and Dale Wales accompanied Fred Bailey and Martin van Rooy for parts of this inspection.

Noticed the flagging along some sections of the Tote road and bends is missing, making it difficult to see the road's direction and or edge in the dark.

1 Please consult with the ore haul truck drivers, to identify those sections of Tote road where additional flagging is required, to assist in travel guidance of the road.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Date of Report 20160129 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed at Milne after the ore haul trucks have dumped their load, the truck is moved away from the dump to check for hang-ups in the trailers and to clean the door gap before closing the dump door. This action requires the operator to walk the full length of the rig in the dark exposing him/her to the mobile equipment working in the area.

2 Please establish an area complete with suitable flood lighting, away from the mobile equipment work area, where the haul trucks can stop and the operator can check for hang-ups and clean their trailers.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

MHSR sect 9.43. *Subject to section 9.44 and unless otherwise specified in these regulations, the manager shall ensure that at all working places on the surface of a mine, suitable and adequate illumination is provided that meets the standards set out in the ANSI/IES Standard RP-7-1979, American National Standard Practice for Industrial Lighting.*

Noticed there are no lights at the ore haul truck-parking area at Milne Inlet requiring the operators to walk to/from their equipment and around their equipment in the dark for their pre-operating inspection.

3 Please install suitable floodlights in the Milne Inlet ore haul truck's parking area so the operators can see and be seen.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

MHSR sect 9.43. *Subject to section 9.44 and unless otherwise specified in these regulations, the manager shall ensure that at all working places on the surface of a mine, suitable and adequate illumination is provided that meets the standards set out in the ANSI/IES Standard RP-7-1979, American National Standard Practice for Industrial Lighting.*

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed Baffinland's procedure requires radio contact with the loader operator when entering his/her area. However, the loader's number is not clearly visible in the dark and therefore this is a problem when trying to contact an individual loader operator when more than one loader is working in the same area.

4 Please ensure a loader's identification is clearly visible during the day and nighttime operation.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed some supervisors are not ensuring that previously reported safety hazards, are not occurring in their work site i.e.
Milne Inlet:
a) site services shop - i) ready access to three fire extinguishers blocked by material stored in front of them, ii) truck HTP 012 battery box removed and the exposed battery terminals were not covered, iii) an electric cable hanging from cable tray in roof and its end not capped and tagged to advise where the other end is located, iv) welding cables lying indiscriminately across the floor without protection,
b) maintenance shop – puddle on floor because the sump is over flowing,
c) site service garage - the high-pressure Hotsy hose and wand is lying unprotected in trailer.
Mary River
a) incinerator building – puddle on floor because the sump is over flowing
b) warehouse – batteries stored without an insulating cover on their posts
c) component rebuild shop – i) oxygen and acetylene cylinders stored together and not separated by 60 feet, ii) oxygen and acetylene cylinders not properly secured to prevent their falling over, iii) two come-a-longs with no safety latches in their hooks. iv) grinding disc lying flat on a horizontal surface

5 Please ensure all supervisors at least once each shift check for safety hazards in their area of responsibility.

MHSR sect 5.07. *Every shift boss or supervisor shall, within his or her area of responsibility and authority,*

Date of Report 20160129 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

(a) carry out the duties set out in the Act and these regulations;
(b) give precedence to the health and safety of persons in his or her charge over any other duties and at the end of his or her shift, communicate with the next shift boss or supervisor all necessary information relating to health and safety concerns;
(c) ensure that all persons in his or her charge are adequately trained and given clear instructions regarding the work they are to perform;
(d) ensure compliance with the relevant provisions of the Act and these regulations;
(e) be knowledgeable about essential safeguards against hazards and about safe working procedures at the worksites for which he or she is responsible so that he or she can routinely assess the safety of the environment and operations affecting persons in those worksites;
(f) by thorough supervision, protect the health and safety of all persons in the area for which he or she is responsible;
(g) make himself or herself familiar with all parts of the area for which he or she is responsible including those parts where persons do not normally work and with safe escape routes, refuge stations and other mustering points;
(h) ensure that there is sufficient safety equipment of appropriate standards for the work being performed;
(i) expeditiously investigate and address health and safety matters drawn to his or her attention;
(j) record before the end of every shift in a log-book kept for that purpose, all matters affecting health and safety, making special notes of any unusual or hazardous conditions or deficiencies found during the shift and of any remedial actions taken; and
(k) read and countersign all reports of the previous shift and discuss any health and safety matters of concern and any unusual or hazardous conditions or deficiencies with persons under his or her control before deploying them to their worksites.

Noticed a grizzly-bar grate frame was being fabricated in the Milne Inlet site services shop. A service truck's crane was hooked to the frame and it appeared it was intended to use this crane to place the frame on a grizzly feeder hopper parked next to the crane in the shop. A number of deficiencies were noted, such as the cranes outrigger were not extended, the crane's horizontal boom reach and load capacity was approaching its limit, the frame's lifting lugs were welded perpendicular to its pulling force of the slings and a near horizontal sling angle is used to lift the frame. The supervisor was advised to review the lifting arrangement and not to install the frame with the service truck crane until it was

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

determined that the weight of the frame and its size could safely be installed onto the hopper with the service truck crane.

6 Please ensure no person performs any rigging or operates any hoisting or pulling equipment unless qualified and authorized.

MHSR sect 10.128.(3) *In addition to the requirements of sections 10.13 to 10.15, an operator of a crane, shovel, dragline, boom truck or similar type of equipment that uses a rope or cable to raise, lower or swing a load or materials during its work cycle shall be qualified in accordance with a program acceptable to the chief inspector.*

MHSR sect 10.13. *No person shall operate or service any equipment or system unless he or she has received the minimum training required for that particular equipment or system pursuant to the training program established by the manager under section 6.03 and is authorized to operate or service the equipment or system by his or her supervisor.*

Noticed in Milne Inlet's site services shop, a hot work permit issued for an area used for welding. The Baffinland hot work permit states a fire watch is required for three hours after the hot work is completed. The welder advised they do not stop the hot work three hours before the end of shift as they perform a hot change i.e. the welder works overtime until the next shift takes over. However if a person works overtime in addition to their twelve hour shift, they cannot have twelve hours rest between shifts.

7 Please ensure no person is scheduled to exceeds their twelve hour shift and ensure each person on site has a minimum of twelve hours rest between shifts.

MHSR sect 2.01.(1) *The manager shall not permit the employment of a person on surface of a mine for a period longer than 12 hours in a day and there shall be a minimum of 12 hours of rest between shifts.*

Noticed an oxygen/acetylene welding cart in Milne Inlet site service shop and at Mary River crusher plant `C` without a fire extinguisher, attached to the cart.

Date of Report 20160129 **Inspector** ________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

8 Please check all oxygen/acetylene welding carts and ensure each is equipped with a suitable fire extinguisher

MHSR sect 10.135.(9) *The manager shall ensure that each welding machine and each set of oxygen and flammable gas cylinders in use is equipped with a fire extinguisher that*
(a) has a capacity for extinguishing a fire that is equal to or greater than a minimum Underwriters' Laboratories of Canada classification of 1A, 10B; and
(b) is suitable for class A and B fires.

Noticed a truck air receiver, in the Milne Inlet welding shop, was hooked-up to a 125-psi 60 cfm stationary air compressor. The welder advised they had installed the truck air receiver for added surge capacity from the compressor. He advised there was no engineering design performed for this installation. He was advised to remove the truck air receiver from stationary compressor discharge line, as the air receiver is not CSA approved system only SAE approved and therefore it may not be safe in this application. He complied, and disconnected the truck air receiver.

9 Please ensure no person modifies a high-pressure fluid system unless the modification has been designed or reviewed by an engineer.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

MHSR sect 10.97.(1) *Boilers, compressors and pressure vessels and associated piping and fittings shall be installed and maintained in accordance with CSA Standard B51-95, Boiler, Pressure Vessel and Pressure Piping Code, and the heated or refrigerated fluid plant shall comply with the requirements of the Boiler and Pressure Vessels Act and the regulations under that Act.*

Date of Report 2016 01 29 **Inspector** [signature]

Box 8888 • Yellowknife, NT X1A 2R3 • Telephone: (867) 920-3888 • Toll Free: 1-800-661-0792 • Fax: (867) 873-4596 • Toll Free Fax: 1-866-277-3677

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed in the Milne Inlet welding shop, a blowgun is used for compressed air cleaning. There is no sign at the blowgun, for restricting its use and or warning of the hazard of using compressed air for cleaning.

10 Please review the practice of using compressed air for cleaning and where this procedure is required, ensure-

a) a safe work procedure is developed that addresses without limiting, personal protective equipment, hearing protection, maximum air pressure to the blowgun, barricades around the work area...

b) people, authorized to use compressed air for cleaning, are trained in this safe work procedure, and

c) submit a copy of the safe work procedure for using compressed air for cleaning.

MHSR sect 10.121.(1) *The manager shall identify and supply all suitable personal protective equipment to be worn by the operator for the safe operation of all miscellaneous tools including grinders, chain saws, pneumatic tools and all power activated tools.*

(2) *No person shall use any miscellaneous tool unless*

(a) the person is trained and authorized to use the tool;

(b) the person is wearing, and has received training on, the proper personal protective equipment required for the safe operation of the equipment; and

(c) the personal protective equipment is in good condition.

Noticed the pedestal grinder in Toromont shop at Milne Inlet is not equipped with a vacuum exhaust system, to extract the grinding dust, while grinding.

11 As noted in 12 October 2015 inspection report, please ensure a grinder is equipped with a suitable vacuum system to capture and remove the dust generated by the grinding process.

MHSR sect 10.122.(7) *Powered grinding wheels, other than portable hand held machines, shall be equipped with an exhaust system or other means for removing dust produced during the grinding operation.*

Date of Report 2016 01 29 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the Milne Inlet temporary warehouse building has now become the permanent warehouse building.

12 Please conduct an engineering assessment of this warehouse and submit the certified engineered drawings of this structure certifying it complies with national building code, national fire code and national electrical code.

MHSA art 2.(1) *The owner of a mine shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at the mine.*

(2) *The owner of a mine shall*
(a) implement and maintain work practices that are safe and that do not present undue risk to health; and
(b) provide and maintain healthy and safe worksites.

Noticed the red line field revisions drawn on the electrical schematics posted on the wall of the Milne Inlet E-house #1 and there were no electrical schematic posted on the wall of E-house #2.These as-built electrical revisions need to be up-dated on the original drawings and certified.

13 As previously noted in the 20 December 2014 inspection report, please ensure
a) the single line electrical schematics are revised at suitable intervals not exceeding 3 months, and
b) a clear legible copy of the most recent up-to-date single line schematic is posted on the wall in each electrical switch room and distribution room.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed the soot on the faces of the welders working in the Mary River welding shop and soot is accumulating on the surfaces inside the building. The welders confirmed that soot comes out of their nose, when they blow it into a clean tissue. The welders advised they have ~~a full-face~~ mask pressurized

Date of Report 2016 01 29 **Inspector** ____

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

respirator however, they only wear it for certain work but not all the time, while in the welding shop.

14 Please ensure people working in the welding shop at Milne Inlet and Mary River, wear their full-face mask pressurized respirator at all times while working in the welding shop, to avoid breathing in the contaminated shop air.

MHSR sect 10.135.(10) *The manager shall ensure that persons are protected from fumes, gases, dust, vapours and noise produced during a welding, cutting, brazing or heating operation and that*
(a) where general ventilation at the work is not sufficient a local exhaust system is used to minimize the exposure by persons to airborne contaminants produced by the operation; and
(b) procedures are established to reduce noise levels for persons using welding, burning, cutting, brazing or heating equipment and for persons working in the vicinity.

Noticed the landing at the south end of the mobile maintenance shop in Mary River, is about 12 inches above the shop floor and it is a potential trip hazard.

15 Please install a wide step for access to/from the shop floor to the landing

MHSR sect 1.89. *The manager shall provide a safe means of access to a work site*

Noticed further to the 12 October 2015 inspection report, the lid on the Milne Inlet 40-gallon solvent cleaning tank, was repaired however, the Mary River 40-gallon solvent cleaning tank lid is not repaired.

16 Please install the solvent tank lid's restraining device as per the manufacturer's instructions, to ensure the lid will automatically fall closed, in case of a fire in the solvent tank.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Date of Report 2016 01 29 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the truck wash shop, to wash the ore haul trucks and other mobile equipment, is under construction.

17 Please submit the certified electrical schematics for this shop and confirm the electrical equipment is compliant with CSA M421 Use of Electricity in Mines.

MHSR sect 13.01.(1) *The electrical system and electrical equipment at a mine shall be*
(a) designed in accordance with good engineering practice; and
(b) constructed in accordance with a design and plans that have been certified by a professional engineer.

(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed there were two men working from a Genie manlift and another two men working from a Skyjack scissor lift, inside Toromont's shop. The men on the Genie lift had recorded on their pre-operation sheet, their weight and the weight of tools and material loaded in the basket. However, the men using the Skyjack platform had not recorded their weights on the platform. The work was stopped, as these four men had not been checked-out by Baffinland's training department, for this equipment.

18 Please ensure no person operates any manlift device unless signed-off on Baffinland`s operating procedures, for these devices

MHSR sect 10.133.(1) *The manager shall ensure that a procedure is established for the safe operation, maintenance, inspection and testing of all portable or mobile platforms, scaffolding, bosun's chairs and other types of temporary work or access platforms.*

Noticed there are a number of accessible sections of conveyors in crushing plant 'A', 'B' and 'C' that do

Date of Report 20160129 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

not have nip point guards at their head, tail and tension pulleys.

19 Please install barricades at the crushing and screening plant equipment to prevent access to the moving parts while the equipment is running, or install nip point guards at the head, tail and tension pulleys.

MHSR sect 10.118.(3) *All accessible head, tail, drive and tension pulleys of a conveyor shall be effectively guarded at their nip points and the guards shall extend for a distance of at least 1 m from the nip point.*

Noticed the electrical panel #1 in the Winterhaven camp corridor, has open slots allowing access to the bus duct.

20 Please cover the open slots.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines*

Noticed the broken panic bar on the welding shop exit door and that some of the exit doors, in the Winterhaven camp, could not be opened because of ice build-up.

21 Please check and ensure all exit doors are maintained operational for use in case of an emergency.

MHSR sect 1.159.(1) *The manager shall prepare a procedure for the examination of worksites that provides for examination*
(i) of the emergency arrangements including safe means of egress;

Noticed the steps, to Mary River's incinerator service platform, are damaged.

Date of Report 20160129 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

22 Please repair the damaged steps

MHSR sect 1.89. *The manager shall provide a safe means of access to a work site*

Noticed the electrical panel, in the center of Mary River's site service building north wall, has no steps for ease of access.

23 Please provide a convenient access to the electrical panel.

MHSR sect 1.89. *The manager shall provide a safe means of access to a work site*

Noticed an 18,000 lt jet fuel tanker is parked with some other mobile equipment in Mary River's site service building.

24 Please review the procedure that must be followed for parking this fuel tanker inside this building and determine if the fire detection and protection is adequate when it is parked in this building.

MHSR sect 12.01.(1) *The manager shall ensure that a fire risk assessment is carried out not later than March 31 in each calendar year for all parts of the mine, both underground and surface, and the assessment shall*

(a) identify the potential for a fire or explosion by examining

(i) ignition sources, such as internal combustion engines, malfunctioning equipment, welding and burning and electrical equipment,

(ii) fuel sources such as combustible materials including class A ordinary combustibles and class B flammable and combustible liquids, and

(iii) the proximity of ignition sources to fuel sources, damaged equipment and accumulations of combustible materials;

(b) determine if persons may be exposed to the effect of fire;

(c) identify the need for fire protection and the type of fire protection that should be provided; and

(d) set out measures to be taken to reduce the hazard from fire, including

(i) equipment design,

Date of Report 2016 01 29 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

(ii) adequate maintenance of equipment,
(iii) proper training,
(iv) evacuation procedures,
(v) use of detection and early fire warning devices,
(vi) type of fire suppression equipment, and
(vii) means of egress from a worksite.

(2) *The manager shall ensure that*
(a) a complete audit is made of the fire risk assessment at least annually by a qualified person; and
(b) the results of the fire risk assessment are entered in the log-book kept for that purpose and are made available to an inspector and to the Committee.

MHSR sect 12.11. *The manager shall ensure that suitable warning signs identify all fire hazard areas, including*
(a) fuel storage areas;
(b) explosives storage areas;
(c) timber storage areas; and
(d) fuelling areas.

Noticed the long extension cords used for power to the toilets and frost fighters installed in Mary River's warehouse building.

25 Please install an electrical outlet at the equipment, plug the equipment directly into the outlet and remove the extension cord.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed the METSO HP epoxy backing material drums stored in the component rebuild shop however, the MSDS sheet for this product was not found in the MSDS book.

Date of Report 2016 01 29 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

26 Please ensure the latest version of this products MSDS sheet is available and that the people using this material have read and comply with its safety requirements.

MHSR sect 5.07. *Every shift boss or supervisor shall, within his or her area of responsibility and authority,*
(c) ensure that all persons in his or her charge are adequately trained and given clear instructions regarding the work they are to perform;

As a follow-up on the 28 May 2014 inspection report, the ore haul truck drivers were consulted for the areas along the Tote road where they do not have direct radio communication with the medic. They advised there are still problems at about the 30 and 60 km area of the Tote road.

27 Please consult with the ore haul truck drivers to determine where along the Tote road they are unable to make direct radio contact with the medic and ensure these blind spots are corrected.

MHSR sect 8.44. *There shall be an effective means of communication between the person in charge of the first aid facility and all worksites to be served.*

Noticed a number of changes have occurred in Baffinland's organization

28 Please submit an up-to-date copy of Baffinland's organization chart

MHSR sect 5.05.(1) *The manager shall prepare an organizational chart showing the job titles for the positions within the organization and the reporting relationships between the positions.*

(2) *The manager shall ensure that the areas of responsibility and authority are not so extensive as to prevent a shift boss or supervisor from diligently carrying out his or her duties concerning health and safety.*

Date of Report 2016/01/29 **Inspector** [signature]

February 9, 2016

Mr. Martin Van Rooy
Mines Inspector
Worker's Compensation Commission
PO Box 669
Iqaluit, Nunavut
X0A 0H0

Dear Martin,

Please find below, the Baffinland response to the site inspection dated January 29, 2016.

1. Noticed the flagging along some sections of the Tote road and bends is missing, making it difficult to see the road's direction and or edge in the dark.

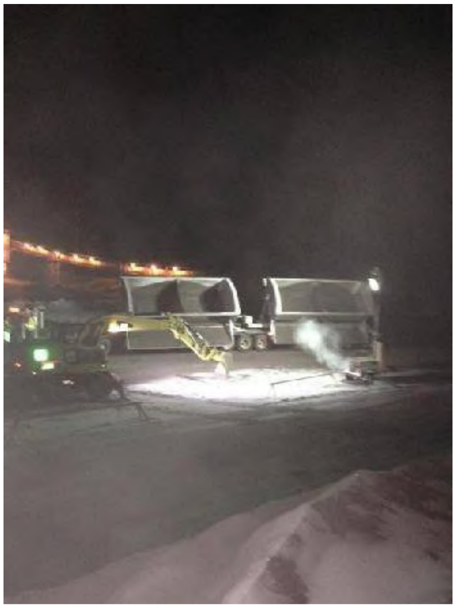
Please consult with the ore haul truck drivers, to identify those sections of Tote road where additional flagging is required, to assist in travel guidance of the road.

RESPONSE: *Completed April 8, 2016.*

2. Noticed at Milne after the ore haul trucks have dumped their load, the truck is moved away from the dump to check for hang-ups in the trailers and to clean the door gap before closing the dump door. This action requires the operator to walk the full length of the rig in the dark exposing him/her to the mobile equipment working in the area.

Please establish an area complete with suitable flood lighting, away from the mobile equipment work area, where the haul trucks can stop and the operator can check for hang-ups and clean their trailers.

Response: *Developed layout for the truck cleaning and positioned light plants accordingly. See photos below.*



3. Noticed there are no lights at the ore haul truck-parking area at Milne Inlet requiring the operators to walk to/from their equipment and around their equipment in the dark for their pre-operating inspection.

Please install suitable floodlights in the Milne Inlet ore haul truck's parking area so the operators can see and be seen.

Response: *Lighting at the laydown area for OHT parking:*

4. Noticed Baffinland's procedure requires radio contact with the loader operator when entering his/her area. However, the loader's number is not clearly visible in the dark and therefore this is a problem when trying to contact an individual loader operator when more than one loader is working in the same area.

Please ensure a loader's identification is clearly visible during the day and nighttime operation.

Response: *Determine and procure sample identification system. Install approved identification system. Target date to complete: May 31, 2016.*

---

5. Noticed some supervisors are not ensuring that previously reported safety hazards, are not occurring in their work site i.e.

Milne Inlet:

a) site services shop - i) ready access to three fire extinguishers blocked by material stored in front of them, ii) truck HTP 012 battery box removed and the exposed battery terminals were not covered, iii) an electric cable hanging from cable tray in roof and its end not capped and tagged to advise where the other end is located, iv) welding cables lying indiscriminately across the floor without protection,
b) maintenance shop – puddle on floor because the sump is over flowing,
c) site service garage - the high-pressure Hotsy hose and wand is lying unprotected in trailer.

Mary River:

a) incinerator building – puddle on floor because the sump is over flowing
b) warehouse – batteries stored without an insulating cover on their posts
c) component rebuild shop – i) oxygen and acetylene cylinders stored together and not separated by 60 feet, ii) oxygen and acetylene cylinders not properly secured to prevent their falling over, iii) two come-a-longs with no safety latches in their hooks. iv) grinding disc lying flat on a horizontal surface

Please ensure all supervisors at least once each shift check for safety hazards in their area of responsibility.

<u>RESPONSE:</u>

Milne Inlet:

5. a) Complete - Sent notice to supervisors of FPM to confirm (and demonstrate) that the immediate hazards listed by the Mines Inspector are addressed. Also sent instruction to all supervisors that upon issuing a daily report (as is often the case) that the expectations henceforth will be to include a section on safety observations of the day, corrective actions taken and etc. This will produce a record capable of demonstrating compliance to the Mines Inspector's report.

5. b) To be pumped regularly – Ongoing. Also, requested warehouse to stock sump pumps.

5. c) Complete February 08, 2016

Mary River:
5. a) To be pumped regularly – Ongoing.
5. b) Complete - The batteries have been covered. (Photo below). Please see attached memo regarding this matter.
5. c) Complete - Grinding disk, come-alongs without hook latch. Both taken out of service and disposed of. Bottles have been taken back to warehouse for proper storage and secured.

---

6. Noticed a grizzly-bar grate frame was being fabricated in the Milne Inlet site services shop. A service truck's crane was hooked to the frame and it appeared it was intended to use this crane to place the frame on a grizzly feeder hopper parked next to the crane in the shop. A number of deficiencies were noted, such as the cranes outrigger were not extended, the crane's horizontal boom reach and load capacity was approaching its limit, the frame's lifting lugs were welded perpendicular to its pulling force of the slings and a near horizontal sling angle is used to lift the frame. The supervisor was advised to review the lifting arrangement and not to install the frame with the service truck crane until it was determined that the weight of the frame and its size could safely be installed onto the hopper with the service truck crane.

Please ensure no person performs any rigging or operates any hoisting or pulling equipment unless qualified and authorized.

Response: *Members of FPM have been trained. This will be ongoing training for those who require it.*

---

7. Noticed in Milne Inlet's site services shop, a hot work permit issued for an area used for welding. The Baffinland hot work permit states a fire watch is required for three hours after the hot work is completed. The welder advised they do not stop the hot work three hours before the end of shift as they perform a hot change i.e. the welder works overtime until the next shift takes over. However if a person works overtime in addition to their twelve hour shift, they cannot have twelve hours rest between shifts.

Please ensure no person is scheduled to exceeds their twelve hour shift and ensure each person on site has a minimum of twelve hours rest between shifts.

Response: We have instructed our supervisors, superintendents and managers not to schedule overtime such that our staff don't have to work past the allowable 12 hours in any given day. If this cannot be achieved, we will ask for a variance for this.

---

8. Noticed an oxygen/acetylene welding cart in Milne Inlet site service shop and at Mary River crusher plant `C` without a fire extinguisher, attached to the cart.

Please check all oxygen/acetylene welding carts and ensure each is equipped with a suitable fire extinguisher

Response:
Completion Date: February 8, 2016.

9. Noticed a truck air receiver, in the Milne Inlet welding shop, was hooked-up to a 125-psi 60 cfm stationary air compressor. The welder advised they had installed the truck air receiver for added surge capacity from the compressor. He advised there was no engineering design performed for this installation. He was advised to remove the truck air receiver from stationary compressor discharge line, as the air receiver is not CSA approved system only SAE approved and therefore it may not be safe in this application. He complied, and disconnected the truck air receiver.

Please ensure no person modifies a high-pressure fluid system unless the modification has been designed or reviewed by an engineer.

Response: *Complete - The modification has been removed. Receiver was disconnected at the Milne welding shop.*

---

10. Noticed in the Milne Inlet welding shop, a blowgun is used for compressed air cleaning. There is no sign at the blowgun, for restricting its use and or warning of the hazard of using compressed air for cleaning.

Please review the practice of using compressed air for cleaning and where this procedure is required, ensure-

a) a safe work procedure is developed that addresses without limiting, personal protective equipment, hearing protection, maximum air pressure to the blowgun, barricades around the work area...
b) people, authorized to use compressed air for cleaning, are trained in this safe work procedure, and
c) submit a copy of the safe work procedure for using compressed air for cleaning.

Response: *Manager to prepare an SOP on cleaning with compressed air units. Target Completion Date: May 31, 2016. The blowgun has been taken out of service until SOP is developed.*

---

11. Noticed the pedestal grinder in Toromont shop at Milne Inlet is not equipped with a vacuum exhaust system, to extract the grinding dust, while grinding.

As noted in 12 October 2015 inspection report, please ensure a grinder is equipped with a suitable vacuum system to capture and remove the dust generated by the grinding process.

Response: Pedestal Grinder has been shut down and removed from use*. Completion Date: February 07, 2016.*

---

12. Noticed the Milne Inlet temporary warehouse building has now become the permanent warehouse building.

Please conduct an engineering assessment of this warehouse and submit the certified engineered drawings of this structure certifying it complies with national building code, national fire code and national electrical code.

Response: *The warehouse at the Port Site will have a engineer assessment for the above items. Completion date: June 30 2016*

---

13. Noticed the red line field revisions drawn on the electrical schematics posted on the wall of the Milne Inlet E-house #1 and there were no electrical schematic posted on the wall of E-house #2.These as-built electrical revisions need to be up-dated on the original drawings and certified.

As previously noted in the 20 December 2014 inspection report, please ensure

a) the single line electrical schematics are revised at suitable intervals not exceeding 3 months, and

b) a clear legible copy of the most recent up-to-date single line schematic is posted on the wall in each electrical switch room and distribution room.

Response: ***New drawings have been created and are under review. They will be posted after review is completed and appropriate corrections made. Drawing mounting boards are to be ordered. Expected completion May 31, 2016***

---

14. Noticed the soot on the faces of the welders working in the Mary River welding shop and soot is accumulating on the surfaces inside the building. The welders confirmed that soot comes out of their nose, when they blow it into a clean tissue. The welders advised they have a full-face mask pressurized respirator however, they only wear it for certain work but not all the time, while in the welding shop.

Please ensure people working in the welding shop at Milne Inlet and Mary River, wear their full-face mask pressurized respirator at all times while working in the welding shop, to avoid breathing in the contaminated shop air.

Response: *Welding helmets are on order at the Port site and are available at the Mine Site. Welders have been instructed to use them. Welding helmets scheduled to arrive at Port Site for May 10, 2016.*

---

15. Noticed the landing at the south end of the mobile maintenance shop in Mary River, is about 12 inches above the shop floor and it is a potential trip hazard.

Please install a wide step for access to/from the shop floor to the landing

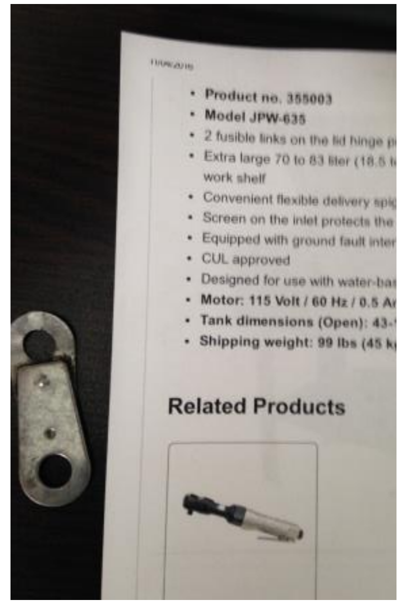
Response: *Completed: February 8, 2016*

---

16. Noticed further to the 12 October 2015 inspection report, the lid on the Milne Inlet 40-gallon solvent cleaning tank, was repaired however, the Mary River 40-gallon solvent cleaning tank lid is not repaired.

Please install the solvent tank lid's restraining device as per the manufacturer's instructions, to ensure the lid will automatically fall closed, in case of a fire in the solvent tank.

Response: *Latch Installed on April 11, 2016*



17. Noticed the truck wash shop, to wash the ore haul trucks and other mobile equipment, is under construction.

Please submit the certified electrical schematics for this shop and confirm the electrical equipment is compliant with CSA M421 Use of Electricity in Mines.

Response: *Completed on February 18, 2016: See file entitled "Item 17 Verification". These files have already been sent*

H349001-4750-70-082-0003-001.pdf H349000-4523-70-095-0001.pdf H349000-4523-70-090-0001.pdf E349000-PM114-70-090-0002.pdf E349000-PM114-70-090-0001.pdf E349000-PM114-50-042-0003.pdf

PH CONTROLLER ATM.PDF HYDROSITE ATM.PDF HYDROKLEEN ATM.PDF HYDROBLASTER ATM.PDF H349001-4750-70-082-0003-002.pdf

18. Noticed there were two men working from a Genie man lift and another two men working from a Skyjack scissor lift, inside Toromont's shop. The men on the Genie lift had recorded on their pre-operation sheet, their weight and the weight of tools and material loaded in the basket. However, the men using the Skyjack platform had not recorded their weights on the platform. The work was stopped, as these four men had not been checked-out by Baffinland's training department, for this equipment.

Please ensure no person operates any man lift device unless signed-off on Baffinland`s operating procedures, for these devices

Response: *Will ensure sign off to BIM procedures before equipment is released to contractors.*

---

19. Noticed there are a number of accessible sections of conveyors in crushing plant 'A', 'B' and 'C' that do not have nip point guards at their head, tail and tension pulleys.

Please install barricades at the crushing and screening plant equipment to prevent access to the moving parts while the equipment is running, or install nip point guards at the head, tail and tension pulleys.

Response: Photo below of barrier with warning.

---

20. Noticed the electrical panel #1 in the Winterhaven camp corridor, has open slots allowing access to the bus duct.

Please cover the open slots.

Response: *Blanks are installed. Completion April 08, 2016*

---

21. Noticed the broken panic bar on the welding shop exit door and that some of the exit doors, in the Winterhaven camp, could not be opened because of ice build-up.

Please check and ensure all exit doors are maintained operational for use in case of an emergency.

Response: *Emergency exit doors have been repaired.*

South End of Arctic Corridor (MSWH)

---

22. Noticed the steps, to Mary River's incinerator service platform, are damaged.

Please repair the damaged steps

Response: *The platform has been repaired.*

Stairs repaired at the Incinerator Building (Mine Site)

---

23. Noticed the electrical panel, in the center of Mary River's site service building north wall, has no steps for ease of access.

Please provide a convenient access to the electrical panel.

Response: *Completed Date: April 12, 2016.*

24. Noticed an 18,000 lt jet fuel tanker is parked with some other mobile equipment in Mary River's site service building.

Please review the procedure that must be followed for parking this fuel tanker inside this building and determine if the fire detection and protection is adequate when it is parked in this building.

Response: *Hot work activities will not be permitted in that building. Signage will be posted. Target Completion Date: March 1, 2016. Completed February 13 2016*

25. Noticed the long extension cords used for power to the toilets and frost fighters installed in Mary River's warehouse building.

Please install an electrical outlet at the equipment, plug the equipment directly into the outlet and remove the extension cord.

Response: *COMPLETED on February 18, 2016*

---

26. Noticed the METSO HP epoxy backing material drums stored in the component rebuild shop however, the MSDS sheet for this product was not found in the MSDS book.

Please ensure the latest version of this products MSDS sheet is available and that the people using this material have read and comply with its safety requirements.

Response: *The MSDS has been made available in the building.*

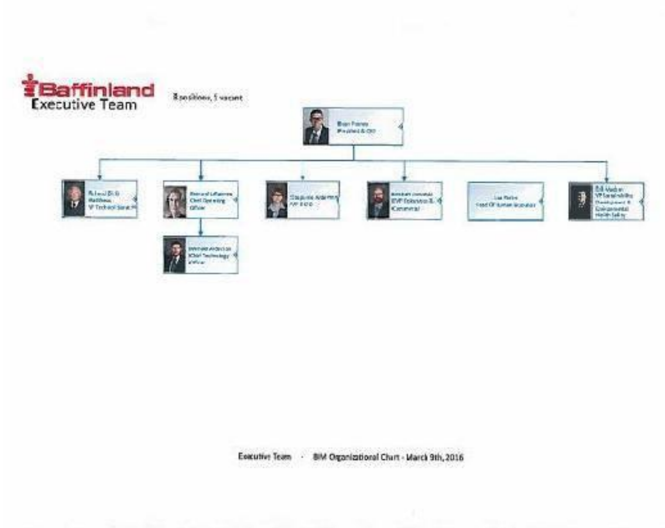
27. As a follow-up on the 28 May 2014 inspection report, the ore haul truck drivers were consulted for the areas along the Tote road where they do not have direct radio communication with the medic. They advised there are still problems at about the 30 and 60 km area of the Tote road.

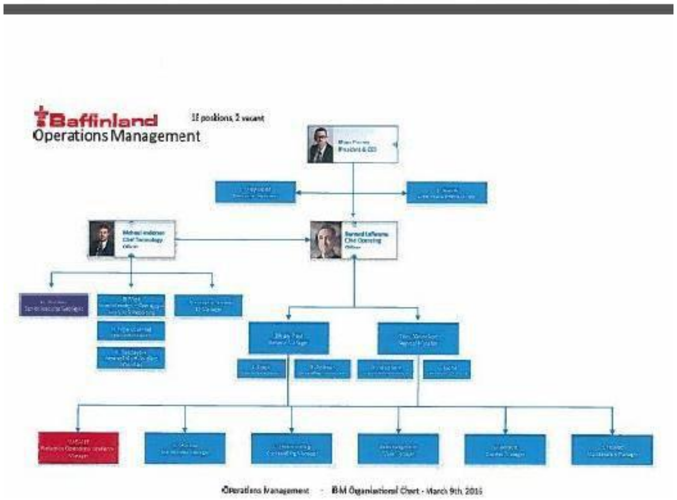
Please consult with the ore haul truck drivers to determine where along the Tote road they are unable to make direct radio contact with the medic and ensure these blind spots are corrected.

Response: *Install and program repeater. Target Completion Date: April 30, 2016*

28. Noticed a number of changes have occurred in Baffinland's organization

Please submit an up-to-date copy of Baffinland's organization chart





Response: *Org chart sent March 15, 2016*

Should you have any questions regarding this submission please contact Bernard Laflamme by phone at 647.253.0596 ext. 6091 or email at bernard.laflamme@baffinland.com .

Dear Mr. Laflamme:

Further to the **Mine Health and Safety Act article 26** attached is my 20160519 Mary River project inspection report.

As per **MHSA article**

28. Please post a copy of this inspection report in a conspicuous location, and

29. Advise the chief inspector within 30 days of the remedial measures taken and the remedial measures still to be taken in respect of the inspection report.

32.(1) A person who is adversely affected by a decision or order issued by an inspector may appeal the decision or order, in writing, to the chief inspector within 30 days after its issue.

The WSCC is committed to service excellence. If you have any questions or concerns about this inspection report, please feel free to contact my supervisor Fred Bailey or myself. His phone number is 867 669 4430 or email fred.bailey@wscc.nt.ca.

Sincerely
Workers' Safety and Compensation Commission of the NWT and NU Mine Safety

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Mine:	Mary River project	Location:	~950 km NW of Iqaluit		
Operator:	Baffinland Iron Mines Corp.	Lat.	71-19'N	Long.	79-24'W
Manager:	Bernard Laflamme	Inspection Date:		20160504 to 10	
Address	2275 Upper Middle Road East - Suite 300 Oakville ON L6H 0C3				

Martin van Rooy (engineer/mine inspector) conducted a general safety inspection of Baffinland's Milne Inlet and Mary River sites. He also performed a Safe Advantage audit of QIL and followed-up on two complaints received from site regarding ore haul truck brakes, wheels falling off the trailers, working of overtime and rest the period, after arrival on site on fly days.

At Milne Inlet:- the ore storage pad, site services shop, welding shop, Toromont's shop, Maintenance shop, site services garage, incinerator building, water treatment plant, Fountain tire's shop, Milne camp kitchen, Winterhaven camp kitchen, powerhouse and warehouse were checked.

At Mary River:- the ERT building, welding shop, maintenance shop, truck wash building, Toromont shop, crushing plants A, B and C, Winterhaven camp kitchen, E-House 7 and 9, incinerator building, site services garage, warehouse, component rebuild shop, water treatment plant, power plant electrical switch rooms 1 and 2, Mary River camp kitchen, laundry facilities and assay laboratory were checked.

Robert Bateman, Steve Campbell, Mark Ebenal, Darryl Finlay, Jerry Hodnett, Matthew Johnson, Brian Larson, Josh Manning, James McMath, Kenneth Mullen, Shawn Pattimore, Christopher Teske and Andrew Thornton, accompanied Martin van Rooy for parts of this inspection.

Noticed a person walking around the perimeter on top of the coarse product pile at Milne Inlet, he was surveying the pile.

1 Please consult with Baffinland's geotechnical consultant to ensure the pile is stable and will not slough or settle when ore is added or removed from the pile; trapping a person accessing the pile or walking on it.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the*

Date of Report 20160519 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

health and safety of employees and other persons at a mine.

MHSR sect 8.20. *Before a person is allowed to work close to or on top of a stockpile of unconsolidated material, the stockpile shall be*
(a) inspected for hazardous conditions by an authorized person; and
(b) made safe.

Noticed there were two STOP signs about 100 feet apart, on the main access road entering the ore storage pad at Milne.

2 Please remove one of the STOP signs to avoid confusion over where to stop for approval to enter the ore stockpile area.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed extension cords and air hoses lying indiscriminately across the floor of the Milne Inlet Fountain Tire shop

3 Please review the practice of allowing electrical cords, hoses and other items... to lie indiscriminately over the ground or across a floor without protection, creating a hazard.

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed an extension cord used to provide power to the following items
a) Herman Nelson heater in the Milne Inlet Fountain Tire shop

Date of Report 20160519 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

b) base station radio in the Milne Inlet site service shop.
c) steam tray in the Milne Inlet Winterhaven kitchen
d) breakfast griddle Mary River camp kitchen
e) buffer tank located in Mary River's assay laboratory

4 Please install an electrical outlet at the heater, radio, steam tray, breakfast griddle, buffer tank... and plug the equipment into the outlet and remove the extension cord.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed the Globe stand-up dough mixer in the Milne Inlet camp kitchen, is hard wired into the electrical circuit. The equipment must be locked-out for cleaning however, because the unit is hard wired into the electrical circuit, an electrician is required to lock it out at the electrical panel.

5 Please install an electrical out-let and plug on the Globe stand-up mixer to allow the kitchen staff to unplug the mixer for cleaning.

MHSR sect 10.21.(1) *The manager shall develop a lock-out procedure for each mechanical or electrical equipment system, and the procedure shall*
(a) include the requirements of subsections (2) to (6) and sections 10.22 and 10.23;
(b) address the sources of all hazards that may be presented when a person is working on the equipment or system; and
(c) specify, before the work starts, how the equipment or system is to be checked to verify that all hazards have been neutralized and that the equipment or system is safe to work on.

Noticed there is water on the floor below the Milne Inlet camp kitchen dishwasher.

6 Please repair the leaking dishwasher.

Date of Report 20160519 **Inspector** ____________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed the welder working in the site service fixed plant shop at Milne and the welder(s) in the welding shop at Mary River had soot on their face. Each one confirmed that soot was present in a tissue when they blew their nose.

7 This is a repeat infraction see inspection reports 29 January 2016 and 12 October 2015. Please ensure people working in the welding shop at Milne Inlet and Mary River, wear their full-face mask pressurized respirator at all times while working in the welding shop area, to avoid breathing in the contaminated shop air.

MHSR sect 10.135.(10) *The manager shall ensure that persons are protected from fumes, gases, dust, vapours and noise produced during a welding, cutting, brazing or heating operation and that*
(a) where general ventilation at the work is not sufficient a local exhaust system is used to minimize the exposure by persons to airborne contaminants produced by the operation; and
(b) procedures are established to reduce noise levels for persons using welding, burning, cutting, brazing or heating equipment and for persons working in the vicinity.

Noticed there is no deadman switch in the wand of the Rigid Kallmann high-pressure hot water washer, in Milne Inlet site service fixed plant shop. Without the deadman switch safety device in the wand, the high-pressure (1750 psi) hot water (140 deg. F) must be shut-off manually at the pump.

8 Please replace the existing wand with a deadman switch equipped wand

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional

Date of Report 20160519 **Inspector** [signature]

engineer; and
(c) acceptable to the chief inspector.

Noticed an electrical panel with open slots located in a kitchen storage seacan at the Milne Inlet Winterhaven kitchen. However, the shelving units in the seacan blocks access to the panel.

9 Please remove the shelving in front of the electrical panel to provide 1m of clear access to the panel and close the open slots.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed the ground conductor is missing from the cable tray located between electrical panels 2540 PNL-001A and 2540 PNL-004B in the Milne Inlet incinerator building.

10 Please install a ground conductor in the cable tray.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed the single line electrical distribution schematics in the electrical rooms at Milne Inlet and at Mary River are stamped ***For Reference – Not for Construction***

11 Please remove these electrical schematics and replace them with the certified ***As Built*** electrical schematics.

Date of Report 20160519 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed the expansion bellow, on the exhaust system of the Milne Inlet diesel fire pump, is extensively stretched and it appears to be beyond the design limit of the bellow.

12 Please check the design limit of the expansion bellows and install a spacer in the exhaust system to release the strain on the bellow.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Noticed there is no berm along the Tote Road at the drop-off at km 40 and at km 52, to prevent a vehicle from going off the road and losing control.

13 Please install berms or barriers at the drop-off located at km 40, km 52 and at other locations along the Tote Road where a vehicle going of the road could loose control.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed the vee-belt guard is missing from the vibrating feeder drive at crushing plant 'A' feed hoper.

14 Please replace the missing vee-belt drive guard to prevent contact with the moving parts and to contain a loose or broken vee-belt.

Date of Report 20160519 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 10.16. *Every*
(a) drive belt, chain, rope or cable,
(b) pulley, sprocket, flywheel or geared wheel,
(c) opening through which any belt, pulley or wheel operates,
(d) bolt, key or set screw,
(e) revolving, reciprocating or relative motion part,
(f) item projecting from a surface, and
(g) counter or tension weight unit and travel path,
and every other item that has motion or relative motion or is hot or electrically energized shall, unless it is so situated as to prevent a person from coming into accidental contact with it, be effectively enclosed, covered or guarded.

Noticed there is no barrier installed for the exposed tail pulley of the conveyor below the vibrating feeder of crusher 'A' and there are no barriers installed to prevent access by a persons to the missing belt conveyor nip-point guards at crushing and screening plant 'A', 'B' and 'C'.

15 This is a repeat infraction see inspection report 29 January 2016. Please install barricades at the crushing and screening plant 'A', 'B' and 'C' to prevent access to the moving conveyor parts or install nip-point guards.

MHSR sect 10.118.(3) *All accessible head, tail, drive and tension pulleys of a conveyor shall be effectively guarded at their nip points and the guards shall extend for a distance of at least 1 m from the nip point.*

Noticed there is a layer of dust present on the floor and on the vertical surfaces of crusher control room 'A'. The crushing plant operator advised he had cleaned the control room earlier in his shift. The dust in the control room is a concern, as the operator is not wearing a respirator for protection from breathing in the dust-contaminated air, in the control room. There is also a large plume of dust coming from crushing and screening plant 'C'; however, the men working in this area are not wearing respirators for protection from breathing in the dust-contaminated air.

Date of Report 20160519 **Inspector** ____________________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

16 The requirement for the crushing and screening plant operators to wear respirators for protection from the dust was previously noted see inspection reports 21 March 2015, 26 July 2014 and 28 May 2014. Please ensure the crushing and screening plant personnel wear a full-face pressurized respirator (some have beards) for protection from the dust in the air, when the crushing plant is running.

MHSR sect 9.02.(1) *Employees shall not be exposed to airborne concentrations of chemical or physical substances in excess of those specified in the 1994-1995 Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices published by the American Conference of Governmental Industrial Hygienists.*

(2) *Where shifts are worked longer than eight hours a day or more than 40 hours a week, the airborne concentration of chemical and physical substances shall not exceed the threshold limit value established under the formula set out in Schedule 4.*

Noticed a long extension cord run from crusher 'C' electrical room through the door, through the water to a heater servicing a seacan workshop installed at crusher 'C'. The extension cord was removed during our inspection.

17 Please install an outdoor electrical outlet at the heater and plug the heater directly into the electrical outlet

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed a fire extinguisher was standing on the floor of Toromont shop at Mary River.

18 Please ensure all fire extinguishers are hung-up and not set on a flat surface where moisture may collect, corroding the bottom of the extinguisher.

Date of Report 20160519 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 12.16.(1) *The manager shall ensure that all fire fighting equipment provided at the mine is maintained by an authorized person.*

(2) *The manager shall ensure that all fire fighting equipment provided at the mine is inspected by an authorized person at least once each month and that the results of the inspection are*
(a) noted on the fire fighting equipment's tag;
(b) entered in a logbook kept for that purpose; or
(c) entered in the mobile equipment logbook.

Noticed the floor of production drill DRL007 cab was relatively clean however, the inside of the half mask respirator, hanging on the wall in the cab, is coated with a layer of dust.

19 Please install a good vacuum cleaner in each drill cab, to assist the operator in keeping his clothing and work area free of drill dust.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed the Caterpillar 930 loader in Nuna's shop was under repair however, it was not locked-out and it had no wheel chocks applied, to prevent unintended movement.

20 Please ensure all contractors on site comply with Baffinland's lockout procedure and apply wheel chocks to prevent unintended movement, of parked equipment.

MHSA art 15. *Where a contractor performs work at a mine, the contractor, the employee or officer of the contractor in charge of the work of the contractor at the mine and the owner and manager of the mine shall, in respect of the work of the contractor at the mine,*
(a) take every reasonable measure and precaution to protect the health and safety of employees of the contractor, employees of the mine and other persons at the mine; and
(b) comply with, and ensure that other persons comply with, this Act and the regulations and any applicable orders or directives issued under this Act or the regulations.

Date of Report 2016 05 19 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the high-pressure hose of the Hotsy high-pressure (2500 psi) hot water (250 deg. F) was being extended with a length of extra hose however, the work was stopped as the fittings used; black iron, brass... are not designed for this high-pressure.

21 Please ensure no person modifies high-pressure, hot or cold water, washing equipment without the approval of the manufacturer or the approval of a professional engineer.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

MHSR sect 10.97.(2) *A boiler, compressor or pressure vessel to which the Boiler and Pressure Vessels Act and the regulations under that Act do not apply shall be maintained in a proper and safe condition by a qualified person.*

Noticed there is no fall protection provided on the vertical access ladder to the rough terrain Grove and Terex crane parked at Mary River. This is a concern as the deck is about 7 feet above the ground and therefore it should have guarding.

22 Please review the operation of all the cranes on site and ensure fall protection is provided to prevent a person on or in the crane from falling to a lower level.

MHSR sect 1.98. *Except in an underground mine, a ladderway at an angle steeper than 70 to the horizontal shall be fixed in place and be provided with*
(a) platforms at intervals not greater than 7 m;
(b) a safety cage; or
(c) a protective device that, when used, will prevent a worker from falling.

Date of Report 20160519 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 1.91. *The manager shall provide every walkway and every working platform more than 1.5 m above the ground with*
(a) a handrail not less than 910 mm nor more than 1.07 m above the floor of the walkway or platform;
(b) a second rail placed at mid-point between the top rail and the floor of the walkway or platform, unless the space between the top rail and the floor is closed by a screen; and
(c) toeboards that extend from the floor to a height of not less than 100 mm.

Noticed there is nearly a 90 deg. bend in the electric cable attached to the electrical panel in the site service change room. The panel also has some open breaker slots allowing access to the energized parts.

23 Please realign the electrical cable and cover the open breaker slots in the electrical panel.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed at Milne Inlet and at Mary River a homemade frame used to support the front end of the ore haul trailers. However, there is no information on the frame, to indicate the maximum safe load limit that may be applied to the frame.

24 Please ensure before using these homemade frames, a professional engineer certifies the maximum safe load that may be applied to the frame and record it on the frame.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Noticed there is a small diesel engine crane operating in the Mary River maintenance shop.

Date of Report 20160519 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

25 Please check the exhaust of this crane and ensure it is equipped with an exhaust gas scrubber.

MHSR sect 10.59.(4) *No diesel or propane powered vehicle or equipment shall be operated inside a building for the purpose of servicing the vehicle unless it is equipped with a exhaust gas scrubber acceptable to an inspector.*

Noticed the materials stored in the Mary River laundry electrical room

26 Please remove the stored material from the electrical room and maintain it free from trip and fire hazards

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed some furnace covers in the Mary River kitchen complex, are removed.

27 Please ensure the furnace cover is replaced on a furnace after it has been removed.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Noticed a small air receiver referred to as a buffer tank, located in the assay laboratory. This air receiver is feed from a larger Champion air compressor however, it is not clear if the small pressure relieve valve

Date of Report 20160519 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

on the buffer tank, can handle the volume of compressed air output from Champion compressor.

28 Please check and ensure that the pressure relieve valve on the buffer tank when tripped, can handle the full volume of compressed air output from the Campion compressor.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Noticed the Champion air compressor and receiver installed in the Assay Laboratory however, it is not clear if the unit is CSA approved.

29 Please submit a copy of the Nunavut boiler and pressure vessel permit for this unit

MHSR sect 10.97.(1) *Boilers, compressors and pressure vessels and associated piping and fittings shall be installed and maintained in accordance with CSA Standard B51-95, Boiler, Pressure Vessel and Pressure Piping Code, and the heated or refrigerated fluid plant shall comply with the requirements of the Boiler and Pressure Vessels Act and the regulations under that Act.*

The complaints received from site regarding ore haul truck brakes, wheels falling off the trailers... were checked and it was found Baffinland is addressing these maintenance problem. However, the rest period, after arrival on site on fly days, is a problem i.e. the Milne Inlet day shift crew on Tuesday May 3 arrived at Milne about 1:30 am May 4 and some of these people were scheduled to start work at 4 am.

30 Please ensure a sufficient rest period is provided to a person after their arrival on site and before they are required to report for work and submit a copy of Baffinland's procedure for travel delay.

MHSA art 2.(1) *The owner of a mine shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at the mine.*

Date of Report 20160519 **Inspector** [signature]

Baffinland

20160613

Martin van Rooy
Engineer/Mines Inspector
WSCC
Iqaluit, Nunavut

Dear Mr. van Rooy:

Further to 20160519 Mary River project inspection report, please see our response to your inspection.

Bikash Paul
General Manager

Mine:	Mary River project	Location:	~950 km NW of Iqaluit
Operator:	Baffinland Iron Mines Corp.	Lat. 71-19'N	Long. 79-24'W
Manager:	Sylvain Proulx	Inspection Date:	20160504 to 10
Address	2275 Upper Middle Road East - Suite 300 Oakville ON L6H 0C3		

Noticed a person walking around the perimeter on top of the coarse product pile at Milne Inlet, he was surveying the pile.

1 Please consult with Baffinland's geotechnical consultant to ensure the pile is stable and will not slough or settle when ore is added or removed from the pile; trapping a person accessing the pile or walking on it.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

MHSR sect 8.20. *Before a person is allowed to work close to or on top of a stockpile of unconsolidated material, the stockpile shall be*
(a) inspected for hazardous conditions by an authorized person; and
(b) made safe.

Response: Please find attached a technical memorandum from our geotechnical consultant regarding the stockpile stability and an inspection form to be used when accessing the stockpile.

Completion: June 05 2016

Noticed there were two STOP signs about 100 feet apart, on the main access road entering the ore storage pad at Milne.

2 Please remove one of the STOP signs to avoid confusion over where to stop for approval to enter the ore stockpile area.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Response:

The stop sign has been removed. Completion: June 12 2016

Noticed extension cords and air hoses lying indiscriminately across the floor of the Milne Inlet Fountain Tire shop

3 Please review the practice of allowing electrical cords, hoses and other items... to lie indiscriminately over the ground or across a floor without protection, creating a hazard.

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed an extension cord used to provide power to the following items
a) Herman Nelson heater in the Milne Inlet Fountain Tire shop
b) base station radio in the Milne Inlet site service shop.
c) steam tray in the Milne Inlet Winterhaven kitchen

d) breakfast griddle Mary River camp kitchen
e) buffer tank located in Mary River's assay laboratory

Response: These items will be complete June 30, 2016

4 Please install an electrical outlet at the heater, radio, steam tray, breakfast griddle, buffer tank... and plug the equipment into the outlet and remove the extension cord.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

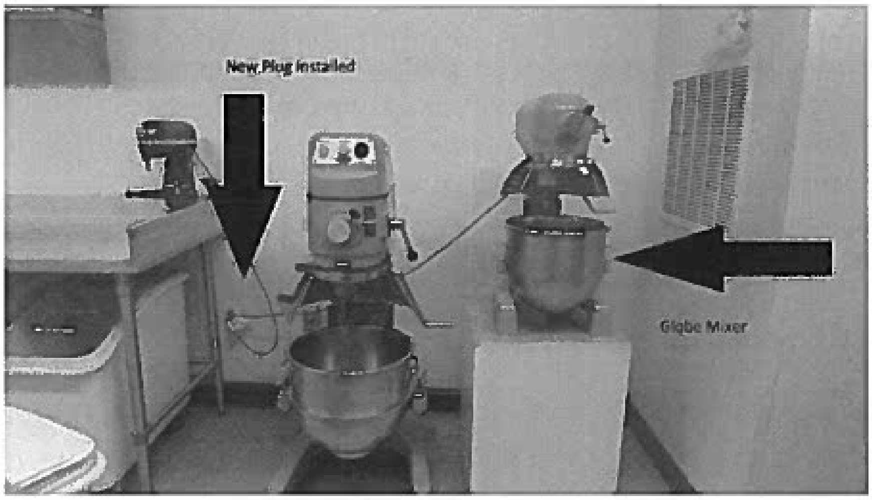
Response: This item is scheduled to be completed July 31, 2016

Noticed the Globe stand-up dough mixer in the Milne Inlet camp kitchen, is hard wired into the electrical circuit. The equipment must be locked-out for cleaning however, because the unit is hard wired into the electrical circuit, an electrician is required to lock it out at the electrical panel.

5 Please install an electrical out-let and plug on the Globe stand-up mixer to allow the kitchen staff to unplug the mixer for cleaning.

MHSR sect 10.21.(1) *The manager shall develop a lock-out procedure for each mechanical or electrical equipment system, and the procedure shall*
(a) include the requirements of subsections (2) to (6) and sections 10.22 and 10.23;
(b) address the sources of all hazards that may be presented when a person is working on the equipment or system; and
(c) specify, before the work starts, how the equipment or system is to be checked to verify that all hazards have been neutralized and that the equipment or system is safe to work on.

Response: The Globe stand up mixer now has a plug installed. Completion: June 09 2016



Noticed there is water on the floor below the Milne Inlet camp kitchen dishwasher.

6 Please repair the leaking dishwasher.

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Response: There is a seal that needs to be replaced on the dishwasher. The seal is ordered. Expected completion date is July 31, 2016

Noticed the welder working in the site service fixed plant shop at Milne and the welder(s) in the welding shop at Mary River had soot on their face. Each one confirmed that soot was present in a tissue when they blew their nose.

7 This is a repeat infraction see inspection reports 29 January 2016 and 12 October 2015. Please ensure people working in the welding shop at Milne Inlet and Mary River, wear their full-face mask pressurized respirator at all times while working in the welding shop area, to avoid breathing in the contaminated shop air.

MHSR sect 10.135.(10) *The manager shall ensure that persons are protected from fumes, gases, dust, vapours and noise produced during a welding, cutting, brazing or heating operation and that*
(a) where general ventilation at the work is not sufficient a local exhaust system is used to minimize the exposure by persons to airborne contaminants produced by the operation; and
(b) procedures are established to reduce noise levels for persons using welding, burning, cutting, brazing or heating equipment and for persons working in the vicinity.

Response: These respirators are ordered. Expected completion date is July 31, 2016

Noticed there is no deadman switch in the wand of the Rigid Kallmann high-pressure hot water washer, in Milne Inlet site service fixed plant shop. Without the deadman switch safety device in the wand, the high-pressure (1750 psi) hot water (140 deg. F) must be shut-off manually at the pump.

8 Please replace the existing wand with a deadman switch equipped wand.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Response: This unit has been taken out of service. Completion: May 15, 2016

Noticed an electrical panel with open slots located in a kitchen storage seacan at the Milne Inlet Winterhaven kitchen. However, the shelving units in the seacan blocks access to the panel.

9 Please remove the shelving in front of the electrical panel to provide 1m of clear access to the panel and close the open slots.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Response: this item is scheduled to be completed June 30, 2016

Noticed the ground conductor is missing from the cable tray located between electrical panels 2540 PNL-001A and 2540 PNL-004B in the Milne Inlet incinerator building.

10 Please install a ground conductor in the cable tray.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Response: expected completion date June 30 2016

Noticed the single line electrical distribution schematics in the electrical rooms at Milne Inlet and at Mary River are stamped ***For Reference – Not for Construction***

11 Please remove these electrical schematics and replace them with the certified ***As Built*** electrical schematics.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

This item is expected to be complete September 31, 2016

Noticed the expansion bellow, on the exhaust system of the Milne Inlet diesel fire pump, is extensively stretched and it appears to be beyond the design limit of the bellow.

12 Please check the design limit of the expansion bellows and install a spacer in the exhaust system to release the strain on the bellow.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and

---

(c) acceptable to the chief inspector.

Response: We need an engineering solution to this problem. Expected completion date is July 31, 2016

Noticed there is no berm along the Tote Road at the drop-off at km 40 and at km 52, to prevent a vehicle from going off the road and losing control.

13 Please install berms or barriers at the drop-off located at km 40, km 52 and at other locations along the Tote Road where a vehicle going of the road could loose control.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Response: Expected completion date is June 30, 2016

Noticed the vee-belt guard is missing from the vibrating feeder drive at crushing plant 'A' feed hoper.

14 Please replace the missing vee-belt drive guard to prevent contact with the moving parts and to contain a loose or broken vee-belt.

MHSR sect 10.16. *Every*
(a) drive belt, chain, rope or cable,
(b) pulley, sprocket, flywheel or geared wheel,
(c) opening through which any belt, pulley or wheel operates,
(d) bolt, key or set screw,
(e) revolving, reciprocating or relative motion part,
(f) item projecting from a surface, and
(g) counter or tension weight unit and travel path,
and every other item that has motion or relative motion or is hot or electrically energized shall, unless it is so situated as to prevent a person from coming into accidental contact with it, be effectively enclosed, covered or guarded.

Response: The guard has been replaced on the vee-belt drive guard. Completion: June 05, 2016

Noticed there is no barrier installed for the exposed tail pulley of the conveyor below the vibrating feeder of crusher 'A' and there are no barriers installed to prevent access by a persons to the missing belt conveyor nip-point guards at crushing and screening plant 'A', 'B' and 'C'.

15 This is a repeat infraction see inspection report 29 January 2016. Please install barricades at the crushing and screening plant 'A', 'B' and 'C' to prevent access to the moving conveyor parts or install nip-point guards.

MHSR sect 10.118.(3) *All accessible head, tail, drive and tension pulleys of a conveyor shall be effectively guarded at their nip points and the guards shall extend for a distance of at least 1 m from the nip point.*

Response: Barriers have been erected to prevent access to moving conveyor parts. Date completed June 07, 2016

Noticed there is a layer of dust present on the floor and on the vertical surfaces of crusher control room 'A'. The crushing plant operator advised he had cleaned the control room earlier in his shift. The dust in the control room is a concern, as the operator is not wearing a respirator for protection from breathing in the dust-contaminated air, in the control room. There is also a large plume of dust coming from crushing and screening plant 'C'; however, the men working in this area are not wearing respirators for protection from breathing in the dust-contaminated air.

16 The requirement for the crushing and screening plant operators to wear respirators for protection from the dust was previously noted see inspection reports 21 March 2015, 26 July 2014 and 28 May 2014. Please ensure the crushing and screening plant personnel wear a full-face pressurized respirator (some have beards) for protection from the dust in the air, when the crushing plant is running.

Response: Completion date July 31, 2016

MHSR sect 9.02.(1) *Employees shall not be exposed to airborne concentrations of chemical or physical substances in excess of those specified in the 1994-1995 Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices published by the American Conference of Governmental Industrial Hygienists.*

(2) *Where shifts are worked longer than eight hours a day or more than 40 hours a week, the airborne concentration of chemical and physical substances shall not exceed the threshold limit value established under the formula set out in Schedule 4.*

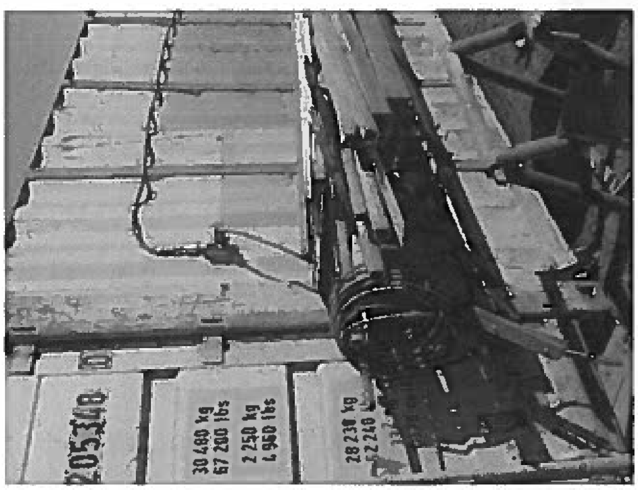
Response:

Noticed a long extension cord run from crusher 'C' electrical room through the door, through the water to a heater servicing a seacan workshop installed at crusher 'C'. The extension cord was removed during our inspection.

17 Please install an outdoor electrical outlet at the heater and plug the heater directly into the electrical outlet

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Response: The extension cord has been removed and an outside plug in has been installed. Also a sign has been placed on the door.



Noticed a fire extinguisher was standing on the floor of Toromont shop at Mary River.

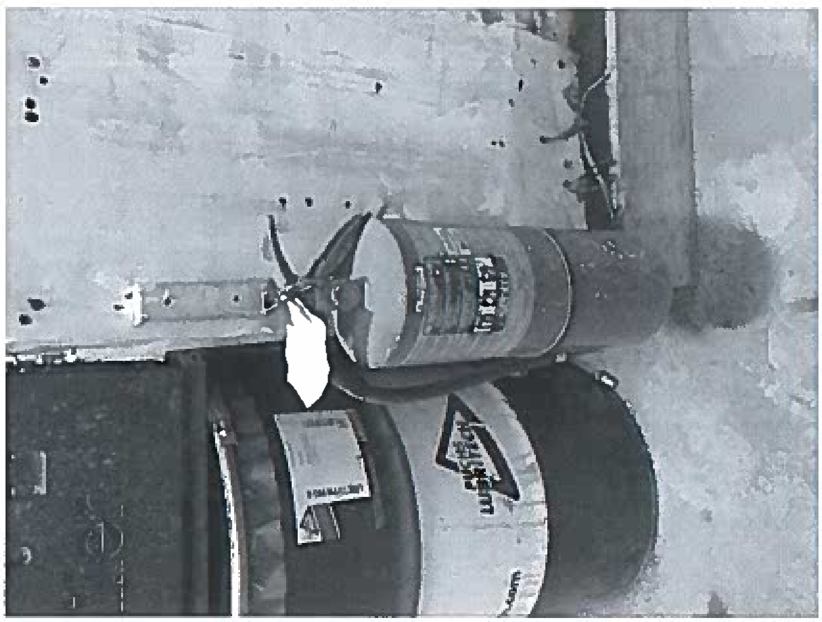
18 Please ensure all fire extinguishers are hung-up and not set on a flat surface where moisture may

collect, corroding the bottom of the extinguisher.

MHSR sect 12.16.(1) *The manager shall ensure that all fire fighting equipment provided at the mine is maintained by an authorized person.*

(2) *The manager shall ensure that all fire fighting equipment provided at the mine is inspected by an authorized person at least once each month and that the results of the inspection are*
(a) noted on the fire fighting equipment's tag;
(b) entered in a logbook kept for that purpose; or
(c) entered in the mobile equipment logbook.

Response: The fire extinguisher has been hung on the wall. Completion date: June 12, 2016



Noticed the floor of production drill DRL007 cab was relatively clean however, the inside of the half mask respirator, hanging on the wall in the cab, is coated with a layer of dust.

19 Please install a good vacuum cleaner in each drill cab, to assist the operator in keeping his clothing and work area free of drill dust.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Response: Vacuum cleaners will be ordered and this will be completed July 31, 2016

Noticed the Caterpillar 930 loader in Nuna's shop was under repair however, it was not locked-out and it had no wheel chocks applied, to prevent unintended movement.

20 Please ensure all contractors on site comply with Baffinland's lockout procedure and apply wheel chocks to prevent unintended movement, of parked equipment.

MHSA art 15. *Where a contractor performs work at a mine, the contractor, the employee or officer of the contractor in charge of the work of the contractor at the mine and the owner and manager of the mine shall, in respect of the work of the contractor at the mine,*
(a) take every reasonable measure and precaution to protect the health and safety of employees of the contractor, employees of the mine and other persons at the mine; and
(b) comply with, and ensure that other persons comply with, this Act and the regulations and any applicable orders or directives issued under this Act or the regulations.

Response: All contractors have received training on BIM Zero Energy Isolation Procedure and on wheel chocking and safety coordinators are doing cyclical audits of all areas to ensure compliance.

Completion: May 14, 2016

Noticed the high-pressure hose of the Hotsy high-pressure (2500 psi) hot water (250 deg. F) was being extended with a length of extra hose however, the work was stopped as the fittings used; black iron, brass... are not designed for this high-pressure.

21 Please ensure no person modifies high-pressure, hot or cold water, washing equipment without the approval of the manufacturer or the approval of a professional engineer.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and

(c) acceptable to the chief inspector.

Response: This unit has been taken out of service. Parts have been ordered per manufactures specifications and will be returned to service once parts arrive.

MHSR sect 10.97.(2) *A boiler, compressor or pressure vessel to which the Boiler and Pressure Vessels Act and the regulations under that Act do not apply shall be maintained in a proper and safe condition by a qualified person.*

Noticed there is no fall protection provided on the vertical access ladder to the rough terrain Grove and Terex crane parked at Mary River. This is a concern as the deck is about 7 feet above the ground and therefore it should have guarding.

22 Please review the operation of all the cranes on site and ensure fall protection is provided to prevent a person on or in the crane from falling to a lower level.

MHSR sect 1.98. *Except in an underground mine, a ladderway at an angle steeper than 70 to the horizontal shall be fixed in place and be provided with*
(a) platforms at intervals not greater than 7 m;
(b) a safety cage; or
(c) a protective device that, when used, will prevent a worker from falling.

MHSR sect 1.91. *The manager shall provide every walkway and every working platform more than 1.5 m above the ground with*
(a) a handrail not less than 910 mm nor more than 1.07 m above the floor of the walkway or platform;
(b) a second rail placed at mid-point between the top rail and the floor of the walkway or platform, unless the space between the top rail and the floor is closed by a screen; and
(c) toeboards that extend from the floor to a height of not less than 100 mm.

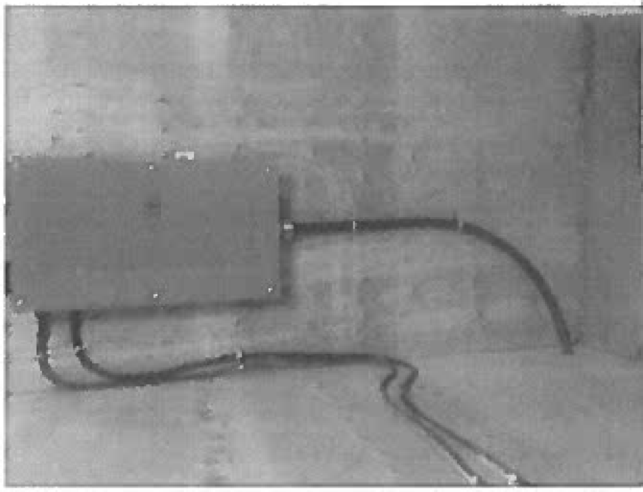
Response: We will require engineering support for this order. Expected completion August 31, 2016

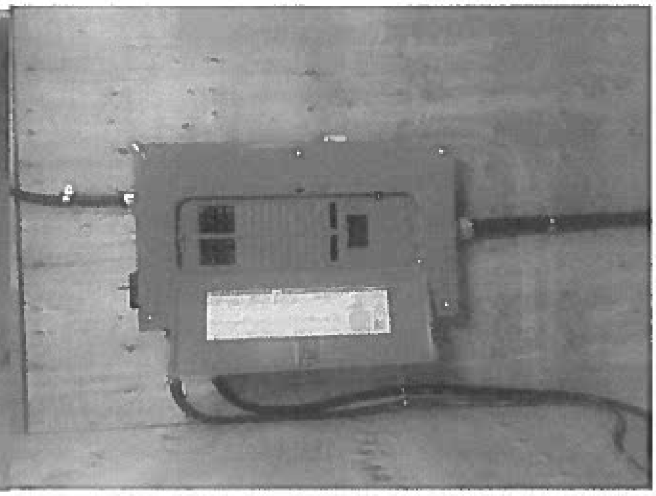
Noticed there is nearly a 90 deg. bend in the electric cable attached to the electrical panel in the site service change room. The panel also has some open breaker slots allowing access to the energized parts.

23 Please realign the electrical cable and cover the open breaker slots in the electrical panel.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Response: this item is complete. June 13, 2016





Noticed at Milne Inlet and at Mary River a homemade frame used to support the front end of the ore haul trailers. However, there is no information on the frame, to indicate the maximum safe load limit that may be applied to the frame.

24 Please ensure before using these homemade frames, a professional engineer certifies the maximum safe load that may be applied to the frame and record it on the frame.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Response: Please see the attached engineer drawings for the stands. Complete June 12, 2016

Noticed there is a small diesel engine crane operating in the Mary River maintenance shop.

25 Please check the exhaust of this crane and ensure it is equipped with an exhaust gas scrubber.

MHSR sect 10.59.(4) *No diesel or propane powered vehicle or equipment shall be operated inside a building for the purpose of servicing the vehicle unless it is equipped with a exhaust gas scrubber acceptable to an inspector.*

Response: Scrubber is ordered. Expected completion date September 30, 2016

Noticed the materials stored in the Mary River laundry electrical room

26 Please remove the stored material from the electrical room and maintain it free from trip and fire hazards

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Response: Materials have been removed from the electrical room. Completed June 12, 2016.

Noticed some furnace covers in the Mary River kitchen complex, are removed.

27 Please ensure the furnace cover is replaced on a furnace after it has been removed.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Response: Covers have been replaced. Completed June 12, 2016

Noticed a small air receiver referred to as a buffer tank, located in the assay laboratory. This air receiver is feed from a larger Champion air compressor however, it is not clear if the small pressure relieve valve on the buffer tank, can handle the volume of compressed air output from Champion compressor.

Response: Expected completion date June 30, 2016

28 Please check and ensure that the pressure relieve valve on the buffer tank when tripped, can handle the full volume of compressed air output from the Campion compressor.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Noticed the Champion air compressor and receiver installed in the Assay Laboratory however, it is not clear if the unit is CSA approved.

Response: Please see response regarding this order named WSCC inspection ALS lab.

---

29 Please submit a copy of the Nunavut boiler and pressure vessel permit for this unit

MHSR sect 10.97.(1) *Boilers, compressors and pressure vessels and associated piping and fittings shall be installed and maintained in accordance with CSA Standard B51-95, Boiler, Pressure Vessel and Pressure Piping Code, and the heated or refrigerated fluid plant shall comply with the requirements of the Boiler and Pressure Vessels Act and the regulations under that Act.*

Response: expected completion date June 30, 2016

The complaints received from site regarding ore haul truck brakes, wheels falling off the trailers... were checked and it was found Baffinland is addressing these maintenance problem. However, the rest period, after arrival on site on fly days, is a problem i.e. the Milne Inlet day shift crew on Tuesday May 3 arrived at Milne about 1:30 am May 4 and some of these people were scheduled to start work at 4 am.

30 Please ensure a sufficient rest period is provided to a person after their arrival on site and before they are required to report for work and submit a copy of Baffinland's procedure for travel delay.

MHSA art 2.(1) *The owner of a mine shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at the mine.*

Response: Please find attached a copy of BIM hours of work policy. Complete June 12, 2016

Sylvain Proulx
Chief Operating Officer
Baffinland Iron Mines Corporation
2275 Upper Middle Road East - Suite 300
Oakville ON L6H 0C3

Dear Mr. Proulx:

Further to the **Mine Health and Safety Act article 26** attached is the 20160720 Mary River project electrical inspection report.

As per **MHSA article**

28. Please post a copy of this inspection report in a conspicuous location, and

29. Advise the chief inspector within 30 days of the remedial measures taken and the remedial measures still to be taken in respect of the inspection report.

32.(1) A person who is adversely affected by a decision or order issued by an inspector may appeal the decision or order, in writing, to the chief inspector within 30 days after its issue.

The WSCC is committed to service excellence. If you have any questions or concerns about this inspection report, please feel free to contact my supervisor Fred Bailey or myself. His phone number is 867 669 4430 or email fred.bailey@wscc.nt.ca.

Sincerely
Workers' Safety and Compensation Commission of the NWT and NU Mine Safety

Martin van Rooy
Engineer/Mines Inspector

WSCC Workers' Safety & Compensation Commission | ᐃᖅᑲᓇᐃᔭᖅᑎᓄᑦ ᐊᑦᑕᓇᖅᑐᓂᒃ ᐊᒻᒪ ᓇᓖᑦᑐᐃᑲᓪᓚᑎᓐᓄᒃ ᖃᐅᔨᓴᖅᑎ

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Mine:	Mary River project	Location:	~950 km NW of Iqaluit		
Operator:	Baffinland Iron Mines Corp.	Lat.	71-19'N	Long.	79-24'W
Manager:	Sylvain Proulx	Inspection Date:		2016012 to 15	
Address	2275 Upper Middle Road East - Suite 300 Oakville ON L6H 0C3				

A general electrical safety inspection was conducted by Mr. J. Fuller, WSCC's electrical consultant, of Baffinland's Milne Inlet and Mary River sites. Mr. Martin van Rooy, WSCC's engineer/mine inspector, was to accompany Mr. Fuller for this inspection however; bad weather in Iqaluit prevented his flight. Mr. Fullers report '*Baffinland Iron Mines – Mary River and Milne Inlet Electrical Inspection*' is attached for information.

Neil Robinson at Milne Inlet and Steve Gogo at Mary River accompanied Mr. Fuller.

Noticed no single line electrical diagram was posted on the wall of Milne Power House B.

1 Please post an up-to-date single line at this Power House.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA -M421 -93, Use of Electricity in Mines*

Some electrical equipment at Milne Inlet and at Mary River, are equipped with molded case breakers however, the adaptor for locking out the breaker, is not present in the electrical room.

2 Please ensure where molded case breakers are used, the lock out station has the adapters for locking out the molded case breakers.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed clutter or storage in front of electrical distribution panels at Milne's 1) Mobile Equipment

Date of Report 20160720 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Maintenance Shop, 2) Mine Rescue Team Building, and 3) Batch Plant.,

3 This is a repeat infraction see inspection report 21 March 2015... Please instruct all supervisors to check all electrical distribution panels in their area routinely, to ensure at least one meter clear working space, free of clutter is maintain around the electrical equipment.

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

MHSR sect 5.07. *Every shift boss or supervisor shall, within his or her area of responsibility and authority,*
(e) be knowledgeable about essential safeguards against hazards and about safe working procedures at the worksites for which he or she is responsible so that he or she can routinely assess the safety of the environment and operations affecting persons in those worksites;

Noticed the fire alarm panel at the Milne Mobile Equipment Maintenance Shop and at the Welding Shop are not active.

4 Please determine if fire detection in these areas is necessary and either remove or activate the installed fire alarm panels.

MHSR sect 12.01.(1) *The manager shall ensure that a fire risk assessment is carried out not later than March 31 in each calendar year for all parts of the mine, both underground and surface, and the assessment shall*
(c) identify the need for fire protection and the type of fire protection that should be provided; and
(d) set out measures to be taken to reduce the hazard from fire, including
(i) equipment design,
(ii) adequate maintenance of equipment,
(iii) proper training,

Date of Report 20160720 **Inspector** ___________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

(iv) evacuation procedures,
(v) use of detection and early fire warning devices,
(vi) type of fire suppression equipment, and
(vii) means of egress from a worksite.

Noticed a personal protection lock left on 1) Panel 2521.2-2A-500 at the Milne Welding shop, 2) on the out of service feeder cable for the wash car fed from the Milne BIM Project Office, and 3) for the long term locking and tagging at panel 2513-PNL-002A in the Milne Mine Rescue Team Building. Personal protection locks should only be used for personal protection when the worker is present and should be removed at end of shift.

5 Please review the Baffinland lockout and tagging procedure and ensure the long-term or out-of-service equipment lockout is addressed and complied with.

MHSR sect 10.21.(1) *The manager shall develop a lock-out procedure for each mechanical or electrical equipment system, and the procedure shall*
(a) include the requirements of subsections (2) to (6) and sections 10.22 and 10.23;
(b) address the sources of all hazards that may be presented when a person is working on the equipment or system; and
(c) specify, before the work starts, how the equipment or system is to be checked to verify that all hazards have been neutralized and that the equipment or system is safe to work on.

Noticed the cables between the Milne Toromont Shop and Office are not secured and protected.

6 Please secure and protect the electrical cables between the Toromont shop and office.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the Teck cable between the main 600V switch and the splitter at the Milne Toromont shop is bent well beyond acceptable minimum radius.

Date of Report 2016 07 20 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

7 Please re-serve the Teck cable in accordance with the Canadian Electrical Code.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the electrical panel of the furnace on the South wall of the Milne Toromont Shop, is damaged preventing the panel door from closing.

8 Please repair the enclosure to restore its rating and permit the door to be closed or replace the enclosure.

Noticed some movable generators are installed without a ground 1) PDG 017 at the ship loader office, 2) the 20kW unit at the Mine 110 laydown area, and 3) the unit at the Mine 110 Communications Sea Can

9 Please Install grounding in accordance with CSA M421-11 Clause 4.4.5.2.2.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed some of the electrical cables at the movable generators, are placing a strain on their connectors/terminations.

10 Please provide a means of securing the cables at movable generators, to remove the strain from connectors/terminations.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed an extension cord is used to supply power to the heat tracing on the sewage line at the ship loader office.

Date of Report 20160720 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

11 Please hardwire the heat trace cable with Teck cable.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed there is an out-of-service feeder cable for the wash car fed from the Milne BIM Project Office Sea can.

12 Please remove the out-of-service feeder cable for the wash car fed from the Milne BIM Project Office Sea can or identify and insulate the end(s).

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the disconnect switches at Milne's Sewage Truck Storage Building, are not accessible from the floor.

13 Please make the distribution panel readily accessible with at least one-meter clear working space.

MHSR sect 1.90. *Where workers are required to work, operate, maintain or service equipment, a safe means of access shall be provided as required by section 1.89.*

Noticed a portable heater and portable compressor fed by an extension cord, located on the access platform for the Milne Mine Rescue Team Building distribution.

14 Please remove the portable heater and portable compressor from the access platform so as not to interfere with electrical equipment access.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the main electrical control panel at the Milne Water Treatment Plant, is on a noticeable slant

Date of Report 20160720 **Inspector** [signature]

because the wooden floor it is attached to, has subsided.

15 Please re-block the platform and ensure that anchoring for this platform is adequate given the increased lean of this panel.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Noticed the sensor on top of the fire pump's diesel tank at the Milne Water Treatment Plant, is bent by a sagged water line because of the subsiding floor.

16 Please secure the water line and repair the sensor.

MHSR sect 10.01.(1) *All mechanical equipment... ...acceptable to the chief inspector.*

Noticed computer power bars used for shop extension cords at the Milne Batch Plant. As noted in previous inspection reports, these devices are not designed for high current loads.

17 Please install electrical outlets for plugging in the equipment and remove the power bars.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the mechanical interlock on the welding receptacle disconnect switch 2521.1 WPD 504 at the Milne Batch Plant, is broken.

18 Please replace the mechanism and restore to proper operation.

Date of Report 2016 07 20 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the access door of the main 600V termination lugs on the portable generators used on the ore pad, is not locked, providing easy access to the live terminals.

19 Please lock or bolt the electrical enclosures to prevent access to the live terminals without the use of tool and post on the access doors, the highest voltage present in the cabinet.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the e-stops on the ship loader and on the reclaim conveyor do not operate when the pull cord is pulled toward the switch.

20 This is a repeat infraction see inspection report 12 October 2015, please ensure pull cords are checked routinely to ensure the e-stop activates for all directions of pull on the cord.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the flags on the above-mentioned e-stops are seized and do not operate when the e-stop trips.

21 Please free up the flags and ensure they operate at the same time as conducting the pull cord tests.

MHSR sect 10.01.(1) *All mechanical equipment... ...acceptable to the chief inspector.*

Noticed the protection relay on breaker H-411 (Crusher 8B Feeder) at the Mary River Power House 2 does not have a test sticker.

22 Please ensure that the relay was tested and apply a sticker to the relay indicating when the relay was tested. Provide evidence of the testing.

Date of Report 2016 07 20 **Inspector** [signature]

WSCC Workers' Safety & Compensation Commission | ᐃᖅᑲᓇᐃᔭᖅᑎᓄᑦ ᐊᑦᑕᓇᖅᑐᓂᒃ ᐊᒻᒪ ᓇᓪᓕᐅᒃᑯᒫᓂᒃ ᖃᐅᔨᓴᖅᑏᑦ

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the insulating gloves stored in cardboard boxes at Mary River Power House 2.

23 Please relocate the insulating gloves to another suitable storage location or provide metal storage cabinets for storage of the gloves and ensure combustible materials are eliminated from switch rooms to the greatest extent possible.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed a few items, not directly associated with the operation and maintenance of the E-Houses at Mary River, stored in the E-Houses

24 Please remove these items.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed a lockout station is provided in some Mary River E-houses, others have lockout stations that have not yet been installed.

25 Please install a lockout station in each E-house at Mary River and Milne and include adapters for locking molded case breaker toggles where applicable

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed the Twin Pack batteries in Mary River's E-House 1, are badly corroded.

Date of Report 20160720 **Inspector** [signature]

Box 8888 • Yellowknife, NT X1A 2R3 • Telephone: (867) 920-3888 • Toll Free: 1-800-661-0792 • Fax: (867) 873-4596 • Toll Free Fax: 1-866-277-3677
Box 669 • Iqaluit, NU X0A 0H0 • Telephone: (867) 979-8500 • Toll Free: 1-877-404-4407 • Fax: (867) 979-8501 • Toll Free Fax: 1-866-979-8501
wscc.nt.ca • wscc.nu.ca

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

26 Please clean and maintain the batteries.

MHSA art 10.(1) *The manager shall... ... employees and other persons at a mine.*

Noticed in-line plugs/receptacles have been installed in two of the 480V cords for Mary River refrigeration units. These plugs are a hazard as they can be pulled under load.

27 Please remove the in-line plugs.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed there is iron ore dust in the crushing plant's E-House 8. The electrical equipment is not designed for this type of environment and hence it requires frequent inspection and cleaning of the internal components.

28 Further to last year's electrical inspection report 20 May 2015 item 18, please advise the frequency the internal components of the switch gear and the transformers were checked for an accumulation of iron ore dust and the frequency it required cleaning.

MHSR sect 13.04. *The manager shall ensure that*
(a) the requirements of sections 10.04 and 10.13 to 10.15 are met in respect of all electrical systems and electrical equipment

MHSR sect 10.04.(3) *The procedure referred to in subsection (1) shall be based on the manufacturer's recommendations and shall*
(d) ensure that a written record of each test, inspection and maintenance work carried out on each unit of equipment or system is entered into a maintenance record specific to each unit of equipment or system and as required in the equipment's or system's log-book; and

Date of Report 20160720 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed there is an unprotected portable power cable running on the ground from e-House 8 to a Sea Can. This unprotected cable is routed through an equipment lay down area and is exposed to vehicle or equipment damage.

29 Please replace the portable cable with Teck cable and re-route it to protect it from physical damage.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed filler plates are required in 1) the lighting panel at the A-side Crusher MCC, and 2) the 20kW generator distribution panel at the Mine 110 laydown area

30 Please install filler plates in 1) and 2) to close opening left by the removed breakers.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed a cable is pulled out of the connector at a 6x6 JB on the tail end of crusher B screen feed conveyor.

31 Please re-secure the cable and ensure adequate strain relief is provided to prevent a recurrence.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed most of the cover screws are missing from the electrical distribution panels at Mary River's Truck Wash Building.

32 Please install all fasteners as per original equipment design.

MHSR sect 13.01.(1) *The electrical system and electrical equipment at a mine shall be*
(a) designed in accordance with good engineering practice; and
(b) constructed in accordance with a design and plans that have been certified by a professional

Date of Report 20160720 **Inspector** [signature]

engineer.

Noticed a sump pump at the South side of the truck wash platform, is fed by an extension cord from a receptacle on the perimeter of the building.

33 Please provide a hardwired permanent receptacle for the sump pump and eliminate the extension cord or remove the sump pump.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed an extension cord run through a window at the Mine 110 laydown office, to feed an adjacent Sea Can.

34 Please provide a permanent feed to the Sea Can and eliminate the extension cord.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the meter box used as a pull box at the Mary River Site Services Office trailer, however, it has no covers.

35 Please provide suitable covers for the enclosure or replace it.

MHSR sect 13.01.(1) *The electrical system... ... professional engineer.*

Noticed there is no working space at the electrical distribution equipment located on both sides of Mary River's Site services Garage.

36 Please provide a minimum of one-meter clear working space for the electrical distribution equipment located on the sides of the building.

Date of Report 2016 07 20 **Inspector** ____________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the 600V switches at splitter 7451-SPL-002, have no labels.

37 Please identify the purpose of these switches and label them with proper printed labels.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed temporary handwritten labels used to identify electrical equipment in some areas of the mine.

38 As noted in inspection report 20 December 2014, please ensure permanent identification labels are installed on electrical equipment throughout the Milne Inlet and Mary River sites.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed the 208V disconnect switches at the Pit Office Distribution Sea Can, are labeled incorrectly.

39 Please install durable printed labels with the correct information.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Noticed at the bit sharpening shop extension cords are used to distribute power throughout the building.

40 Please install permanent wiring in the bit sharpening shop and remove the flexible cords...

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Date of Report 20160720 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed there is a receptacle outside the Pit Office, it is fed from a mini-distribution center via G-GC cable. The G-GC cable has been damaged and a splice has been made with electrical tape.

41 Please remake the splice with a shrink-on sleeve to provide the same protection, strength etc. as the original cable jacket or replace the G-GC cable. Provide GFI protection and ensure the receptacle is rated for this application.

MHSR sect 13.01.(2) *Except... ...CAN/CSA -M421 -93, Use of Electricity in Mines*

Date of Report 20160720 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Baffinland Iron Mines – Mary River and Milne Inlet Electrical Inspection

By: Jeff Fuller – J.A. FULLER ENGINEERING LTD Insp. Date: July 13 - 14, 2016

1) Milne Power House B did not have a single line diagram posted. Please post an up-to-date single line at this Power House.
2) Lock out stations should include adapters for locking molded case breakers where applicable.
3) Milne Mobile Equipment Maintenance Shop had clutter on the access platform for the distribution panels. Maintain one-meter clear working space free of clutter around this type of equipment.
4) Noticed that fire alarm panels at the Milne Mobile Equipment Maintenance Shop and Welding Shop were not active. Determine whether fire detection is necessary in these areas and either remove or activate the installed fire alarm panels.
5) Noticed a personal protection lock left on Panel 2521.2-2A-500 at the Milne Welding shop. Personal protection locks should only be used for personal protection when the worker is present and should be removed at end of shift. Follow the locking and tagging procedure for long term lock-out.
6) Cables between the Milne Toromont Shop and Office need to be secured and protected.
7) Teck cable between the main 600V switch and the splitter at the Milne Toromont shop is bent well beyond acceptable minimum radius. Re-serve in accordance with the Canadian Electrical Code.
8) The furnace on the South wall of the Milne Toromont Shop is damaged. Damage to the electrical panel is preventing the panel door from being closed. Repair or replace as required to restore the enclosure rating and permit the door to be closed.
9) Generator PDG 017 at the ship loader office has no ground. Install grounding in accordance with CSA M421-11 Clause 4.4.5.2.2.
10) Heat tracing on the sewage line at the ship loader office is connected via extension cord from the far side of the trailer. Hardwire the heat trace cable with Teck cable.
11) The out of service feeder cable for the wash car fed from the Milne BIM Project Office Sea can must be removed or insulated and identified.
12) A personal protection lock has been used for long term tagging of the above mentioned out of service wash car feeder switch. Follow locking and tagging procedure for long term locking and tagging.
13) Disconnect switches at the Milne Sewage Truck Storage Building are not accessible from the floor. Make the distribution readily accessible with one meter clear working space.

Date of Report 20160720 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

14) A personal protection lock has been used for long term locking and tagging at panel 2513-PNL-002A in the Milne Mine Rescue Team Building. Follow the locking and tagging procedure for long term locking and tagging.
15) A portable heater was temporarily stored on the access platform for the Milne Mine Rescue Team Building distribution. Other clutter was present on the platform as well. One meter clear working space must be maintained at all times. A portable compressor was located on the access platform and fed by an extension cord. Relocate the compressor so as not to interfere with electrical equipment access and to eliminate the extension cord.
16) At the Milne Water Treatment Plant the floor has subsided to the point that the main electrical control panel is on a noticeable slant. This panel is secured to a relatively narrow wooden platform. Ensure that anchoring for this platform is adequate given the increasing lean.
17) At the Milne Water Treatment Plant the sensor on top of the diesel tank for the fire pump has been bent almost to the point of breaking by a water line that has sagged as a result of the subsiding floor. Secure the water line and repair the sensor.
18) At the Milne Batch Plant computer power bars have been used for shop extension cords. These devices are not designed for high current loads. Remove the power bars and replace with permanent means of plugging in equipment as required.
19) At the Milne Batch Plant the mechanical interlock on the welding receptacle disconnect switch 2521..1 WPD 504 is broken. Replace the mechanism and restore to proper operation.
20) At the Milne Batch Plant sheet steel has been placed in front of a lighting panel such as to make it inaccessible. Maintain one meter clear working space.
21) Noticed that the portable generators used on the ore pad have main 600V termination lugs accessible without the use of tools. The latches on these access doors have provision for locking. Lock electrical enclosures that access live terminals without the use of tools.
22) Post the highest voltage (600V) on the above mentioned access doors.
23) Noticed that e-stops on the ship loader and on the reclaim conveyor do not operate when the pull cord is pulled toward the switch. Inadequate tension seems to be the problem. Re-tension these pull cords and include testing of e-stops in regular maintenance.
24) The flags on the above mentioned e-stops are seized and do not operate when the e-stop trips. These are monitoring devices and do not interfere with operation of the switch. Free up and test operation of the flags at the same time as the pull cord tests.

Date of Report 20160720 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

25) The protection relay on breaker H-411 (Crusher 8B Feeder) at the Mary River Power House 2 does not have a test sticker. Ensure that the relay was tested, apply a sticker indicating when the relay was tested, and provide evidence of the testing.
26) Insulating gloves are stored in cardboard boxes at Mary River Power House 2. Relocate the insulating gloves to another suitable storage location or provide metal storage cabinets. Eliminate combustible materials from switch rooms to the greatest extent possible.
27) Mary River E-Houses general note – a few items were noticed that are not directly associated with operation and maintenance of the E-Houses. These items should be removed.
28) Lockout stations are provided at some Mary River E-houses. Some have lockout stations that have not yet been installed. Apply a uniform policy. Include adapters for locking molded case breaker toggles where applicable.
29) Mary River E-House 1 Twin Pack batteries are badly corroded. Clean and maintain the batteries.
30) In-line plugs/receptacles have been installed in two of the 480V cords for Mary River refrigeration units. These plugs can be pulled under load. Remove the in-line plugs.
31) Mary River E-House 8 at the Crushers is very dusty. Show evidence of inspection of the transformers and switchgear to determine cleaning requirements and a schedule for periodic cleaning. After the electrical inspection in May of 2015 it was requested that a periodic inspection and cleaning be initiated. The equipment is not designed for this type of environment and hence requires periodic inspection and cleaning of internal components.
32) A portable power cable running from e-House 8 to a Sea Can is not protected and is in a lay down area for equipment where it will be damaged by vehicles or equipment. Replace with Teck cable and re-route to protect the cable from physical damage.
33) At the A-side Crusher MCC the lighting panel requires filler plates to close opening left by breakers being removed.
34) A cable is pulled out of the connector at a 6x6 JB on the tail end of the B spread screen feed conveyor. Re-secure the cable and ensure adequate strain relief to prevent a recurrence.
35) At the Mary River Truck Wash Building most of the cover screws are missing from the electrical distribution panels. Install all fasteners as per original equipment design.
36) At the South side of the truck wash platform a sump pump is fed by an extension cord from a receptacle on the perimeter of the building. If this sump pump is required then provide a hardwired permanent receptacle for it and eliminate the extension cord.

Date of Report 2016 07 20 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

37) At the Mine 110 laydown area the 20kW generator is not grounded. Provide grounding in accordance with CSA M421-11 Clause 4.4.5.2.2.
38) Provide filler plates for the distribution panel in the above mentioned generator.
39) At the Mine 110 laydown office an extension cord is run through a window to feed an adjacent Sea Can. Provide a permanent feed as required and eliminate the extension cord.
40) Provide a means of securing cables at movable generators to remove strain from connectors/terminations.
41) The generator at the 110 Communications Sea Can does not appear to be grounded. Provide grounding for the generator.
42) At the Mary River Site Services Office trailer the meter box is used as a pull box but has no covers. Provide suitable covers for the enclosure or replace it.
43) At the Mary River Site services Garage one meter clear working space is required for electrical distribution equipment on both sides of the building.
44) 600V switches at splitter 7451-SPL-002 have no labels. Identify the purpose of these switches with proper printed labels.
45) Implement a program to replace handwritten temporary labels with durable printed labels suitable for the environment.
46) At the Pit Office Distribution Sea Can 208V disconnect switches are labeled incorrectly. Install durable printed labels with the correct information.
47) At the bit sharpening shop extension cords have been used to distribute power throughout the building. Replace flexible cord with suitable permanent wiring methods.
48) Outside the Pit Office a receptacle is fed from a mini-distribution center via G-GC cable. The G-GC cable has been damaged and a splice has been made with electrical tape. Remake the splice with a shrink-on sleeve which affords the same protection, strength etc. as the original cable jacket or replace the G-GC. Provide GFI protection. Ensure that the receptacle is properly rated for the application.

The following individuals participated in electrical inspections:
Milne Inlet – Neil Robinson (electrical)
Mary River – Steve Gogo (electrical)

Date of Report 20160720 **Inspector** [signature]

20160721 – ELECTRICAL INSPECTION

August 8, 2016

Martin van Rooy
WSCC Mines Inspector
Iqaluit, Nunavut

Dear Mr. van Rooy:

Further to 20160721 Mary River project electrical and geotechnical inspection reports, please see our response to your inspection.

Best Regards,
Bikash Paul
General Manager

ELECTRICAL INSPECTION:

Noticed no single line electrical diagram was posted on the wall of Milne Power House B.

1 Please post an up-to-date single line at this Power House.

Response: Expected completion September 30, 2016

Some electrical equipment at Milne Inlet and at Mary River, are equipped with molded case breakers however, the adaptor for locking out the breaker, is not present in the electrical room.

2 Please ensure where molded case breakers are used, the lock out station has the adapters for locking out the molded case breakers.

Response: Adaptors for locking molded case breakers are received Expected completion date October 30, 2016

Noticed clutter or storage in front of electrical distribution panels at Milne's 1) Mobile Equipment Maintenance Shop, 2) Mine Rescue Team Building, and 3) Batch Plant.,

3 This is a repeat infraction see inspection report 21 March 2015... Please instruct all supervisors to check all electrical distribution panels in their area routinely, to ensure at least one meter clear working space, free of clutter is maintain around the electrical equipment.

`

The equipment stored in front of the electrical panel at the MRT garage has been removed. Completed July 27, 2016

Above pic is the MRT – complete.

Noticed the fire alarm panel at the Milne Mobile Equipment Maintenance Shop and at the Welding Shop are not active.

4 Please determine if fire detection in these areas is necessary and either remove or activate the installed fire alarm panels.

Item to be completed November 31st 2016

Noticed a personal protection lock left on 1) Panel 2521.2-2A-500 at the Milne Welding shop, 2) on the out of service feeder cable for the wash car fed from the Milne BIM Project Office, and 3) for the long term locking and tagging at panel 2513-PNL-002A in the Milne Mine Rescue Team Building. Personal protection locks should only be used for personal protection when the worker is present and should be removed at end of shift.

5 Please review the Baffinland lockout and tagging procedure and ensure the long-term or out-of-service equipment lockout is addressed and complied with.

RESPONSE:

BEFORE

AFTER

BEFORE

AFTER

All items to be completed by September 21st 2016.

Noticed the cables between the Milne Toromont Shop and Office are not secured and protected.

6 Please secure and protect the electrical cables between the Toromont shop and office.

RESPONSE:

Picture shows completion of action item.

Noticed the Teck cable between the main 600V switch and the splitter at the Milne Toromont shop is bent well beyond acceptable minimum radius.

7 Please re-serve the Teck cable in accordance with the Canadian Electrical Code.

RESPONSE:

Picture above shows completion.

Noticed the electrical panel of the furnace on the South wall of the Milne Toromont Shop, is damaged preventing the panel door from closing.

8 Please repair the enclosure to restore its rating and permit the door to be closed or replace the enclosure.

`

Item completed – pictures forthcoming.

Noticed some movable generators are installed without a ground 1) PDG 017 at the ship loader office, 2) the 20kW unit at the Mine 110 laydown area, and 3) the unit at the Mine 110 Communications Sea Can

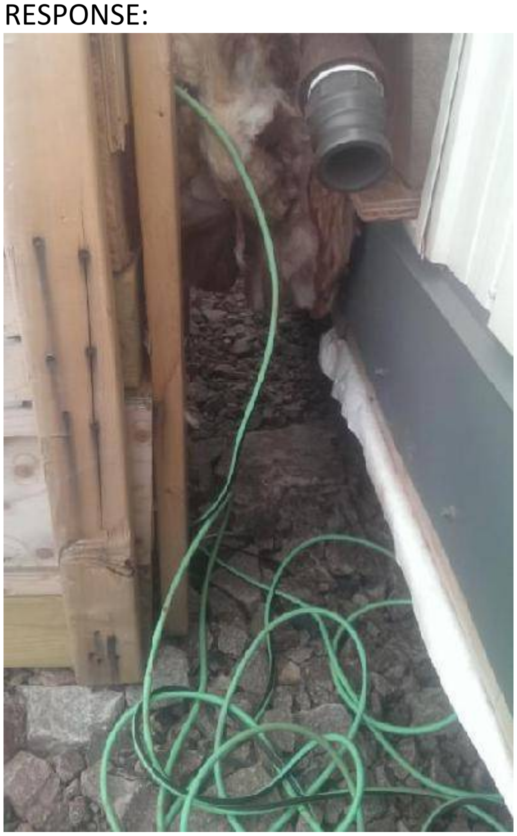
9 Please Install grounding in accordance with CSA M421-11 Clause 4.4.5.2.2.

Item completed

Noticed some of the electrical cables at the movable generators, are placing a strain on their connectors/terminations.

10 Please provide a means of securing the cables at movable generators, to remove the strain from connectors/terminations.

RESPONSE:



BEFORE

AFTER

Noticed an extension cord is used to supply power to the heat tracing on the sewage line at the ship loader office.

`

11 Please hardwire the heat trace cable with Teck cable.

Item completed

Noticed there is an out-of-service feeder cable for the wash car fed from the Milne BIM Project Office Sea can.

12 Please remove the out-of-service feeder cable for the wash car fed from the Milne BIM Project Office Sea can or identify and insulate the end(s).

RESPONSE: Item 12 to be completed by October 31st 2016

Noticed the disconnect switches at Milne's Sewage Truck Storage Building, are not accessible from the floor.

13 Please make the distribution panel readily accessible with at least one-meter clear working space.

Response: Item to be completed by November 31st 2016

Noticed a portable heater and portable compressor fed by an extension cord, located on the access platform for the Milne Mine Rescue Team Building distribution.

14 Please remove the portable heater and portable compressor from the access platform so as not to interfere with electrical equipment access.

RESPONSE: Item completed – September 2016.

Noticed the main electrical control panel at the Milne Water Treatment Plant, is on a noticeable slant because the wooden floor it is attached to, has subsided.

15 Please re-block the platform and ensure that anchoring for this platform is adequate given the increased lean of this panel.

Completed –

Noticed the sensor on top of the fire pump's diesel tank at the Milne Water Treatment Plant, is bent by a sagged water line because of the subsiding floor.

16 Please secure the water line and repair the sensor.

STEE
Clemm

Completed – pic above is rotated 90degrees.

Noticed computer power bars used for shop extension cords at the Milne Batch Plant. As noted in previous inspection reports, these devices are not designed for high current loads.

17 Please install electrical outlets for plugging in the equipment and remove the power bars.

To be completed November 31st 2016

Noticed the mechanical interlock on the welding receptacle disconnect switch 2521.1 WPD 504 at the Milne Batch Plant, is broken.

18 Please replace the mechanism and restore to proper operation.

Item completed

Noticed the access door of the main 600V termination lugs on the portable generators used on the ore pad, is not locked, providing easy access to the live terminals.

19 Please lock or bolt the electrical enclosures to prevent access to the live terminals without the use of tool and post on the access doors, the highest voltage present in the cabinet.

Item completed

Noticed the e-stops on the ship loader and on the reclaim conveyor do not operate when the pull cord is pulled toward the switch.

20 This is a repeat infraction see inspection report 12 October 2015, please ensure pull cords are checked routinely to ensure the e-stop activates for all directions of pull on the cord.

To be completed September 21st 2016

Noticed the flags on the above-mentioned e-stops are seized and do not operate when the e-stop trips.

21 Please free up the flags and ensure they operate at the same time as conducting the pull cord tests.

Response: Item 21 tentative completion October 31st; depending on delivery of components that may be required.

Noticed the protection relay on breaker H-411 (Crusher 8B Feeder) at the Mary River Power House 2 does not have a test sticker.

22 Please ensure that the relay was tested and apply a sticker to the relay indicating when the relay was tested. Provide evidence of the testing.

RESPONSE:

BEFORE AFTER

Noticed the insulating gloves stored in cardboard boxes at Mary River Power House 2.

23 Please relocate the insulating gloves to another suitable storage location or provide metal storage cabinets for storage of the gloves and ensure combustible materials are eliminated from switch rooms to the greatest extent possible.

RESPONSE:
Insulating gloves and material stored in switch room.

Noticed a few items, not directly associated with the operation and maintenance of the E-Houses at Mary River, stored in the E-Houses

24 Please remove these items.

RESPONSE:
Items were removed.

Noticed a lockout station is provided in some Mary River E-houses, others have lockout stations that have not yet been installed.

25 Please install a lockout station in each E-house at Mary River and Milne and include adapters for locking molded case breaker toggles where applicable

RESPONSE:

Noticed the Twin Pack batteries in Mary River's E-House 1, are badly corroded.

26 Please clean and maintain the batteries.

Item to be completed September 21st 2016.

Noticed in-line plugs/receptacles have been installed in two of the 480V cords for Mary River refrigeration units. These plugs are a hazard as they can be pulled under load.

27 Please remove the in-line plugs.
Item may require investigation – completion target October 31st.

Noticed there is iron ore dust in the crushing plant's E-House 8. The electrical equipment is not designed for this type of environment and hence it requires frequent inspection and cleaning of the internal components.

28 Further to last year's electrical inspection report 20 May 2015 item 18, please advise the frequency the internal components of the switch gear and the transformers were checked for an accumulation of iron ore dust and the frequency it required cleaning.

RESPONSE:
The iron ore dust in e-house 8 has been cleaned up. Regular cleaning will continue.

Noticed there is an unprotected portable power cable running on the ground from e-House 8 to a Sea Can. This unprotected cable is routed through an equipment lay down area and is exposed to vehicle or equipment damage.

29 Please replace the portable cable with Teck cable and re-route it to protect it from physical damage.

RESPONSE:
Portable power cable feeding sea can was replaced with armored cable and rerouted.

Noticed filler plates are required in 1) the lighting panel at the A-side Crusher MCC, and 2) the 20kW generator distribution panel at the Mine 110 laydown area

30 Please install filler plates in 1) and 2) to close opening left by the removed breakers.

RESPONSE:
Filler plates installed.

Noticed a cable is pulled out of the connector at a 6x6 JB on the tail end of crusher B screen feed conveyor.

31 Please re-secure the cable and ensure adequate strain relief is provided to prevent a recurrence.

Completion October 31st 2016.

Noticed most of the cover screws are missing from the electrical distribution panels at Mary River's Truck Wash Building.

32 Please install all fasteners as per original equipment design.

RESPONSE:
Fasteners installed.

Noticed a sump pump at the South side of the truck wash platform, is fed by an extension cord from a receptacle on the perimeter of the building.

33 Please provide a hardwired permanent receptacle for the sump pump and eliminate the extension cord or remove the sump pump.

RESPONSE:
Truck wash sump pump hard wires receptacle.

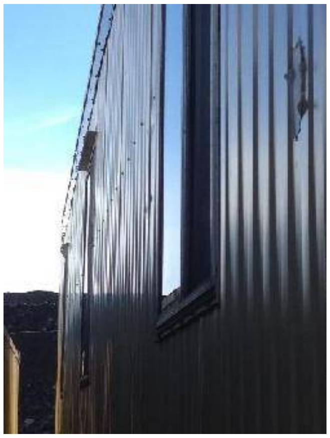
Noticed an extension cord run through a window at the Mine 110 laydown office, to feed an adjacent Sea Can.

34 Please provide a permanent feed to the Sea Can and eliminate the extension cord.

`

RESPONSE:



Noticed the meter box used as a pull box at the Mary River Site Services Office trailer, however, it has no covers.

35 Please provide suitable covers for the enclosure or replace it.

RESPONSE:
Cover placed on meter box.

Noticed there is no working space at the electrical distribution equipment located on both sides of Mary River's Site services Garage.

36 Please provide a minimum of one-meter clear working space for the electrical distribution equipment located on the sides of the building.

Completed August 15, 2016

Noticed the 600V switches at splitter 7451-SPL-002, have no labels.

37 Please identify the purpose of these switches and label them with proper printed labels.

RESPONSE:
Labels posted.

Noticed temporary handwritten labels used to identify electrical equipment in some areas of the mine.

38 As noted in inspection report 20 December 2014, please ensure permanent identification labels are installed on electrical equipment throughout the Milne Inlet and Mary River sites.

Item to be completed October 31st 2016.

Noticed the 208V disconnect switches at the Pit Office Distribution Sea Can, are labeled incorrectly.

39 Please install durable printed labels with the correct information.

RESPONSE:
Pit office disconnect labeled properly.

Noticed at the bit sharpening shop extension cords are used to distribute power throughout the building.

40 Please install permanent wiring in the bit sharpening shop and remove the flexible cords...

RESPONSE:

Noticed there is a receptacle outside the Pit Office, it is fed from a mini-distribution center via G-GC cable. The G-GC cable has been damaged and a splice has been made with electrical tape.

41 Please remake the splice with a shrink-on sleeve to provide the same protection, strength etc. as the original cable jacket or replace the G-GC cable. Provide GFI protection and ensure the receptacle is rated for this application.

RESPONSE:

Chief Operating Officer
Baffinland Iron Mines Corporation
2275 Upper Middle Road East - Suite 300
Oakville ON L6H 0C3

Dear Mr. Proulx:

Further to the **Mine Health and Safety Act article 26** attached is the 20160721 Mary River project geotechnical inspection report.

As per **MHSA article**

28. Please post a copy of this inspection report in a conspicuous location, and

29. Advise the chief inspector within 30 days of the remedial measures taken and the remedial measures still to be taken in respect of the inspection report.

32.(1) A person who is adversely affected by a decision or order issued by an inspector may appeal the decision or order, in writing, to the chief inspector within 30 days after its issue.

The WSCC is committed to service excellence. If you have any questions or concerns about this inspection report, please feel free to contact my supervisor Fred Bailey or myself. His phone number is 867 669 4430 or email fred.bailey@wscc.nt.ca.

Sincerely
Workers' Safety and Compensation Commission of the NWT and NU Mine Safety

Martin van Rooy

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Mine:	Mary River project	Location:	~950 km NW of Iqaluit		
Operator:	Baffinland Iron Mines Corp.	Lat.	71-19'N	Long.	79-24'W
Manager:	Sylvain Proulx	Inspection Date:		2016012 to 15	
Address	2275 Upper Middle Road East - Suite 300 Oakville ON L6H 0C3				

A geotechnical inspection was conducted by Mr. Michael Cullen, WSCC's geotechnical, of Baffinland's Milne Inlet and Mary River sites. Mr. Martin van Rooy, WSCC's engineer/mine inspector, was to accompany Mr. Cullen for this inspection however; bad weather in Iqaluit prevented his flight. The site review included the pit, waste rock dump, Mary River quarries, ore load out dock, ore stockpiles, and Milne quarry. Mr. Cullen's report '*Geotechnical Review of Mary River Project: July 13, 14, 15 2016*' is attached for information.

Darryl Finlay at Milne Inlet and Jeremy Moar at Mary River accompanied Mr. Cullen for this inspection.

Noticed the mine has restricted access to the danger zone at the crest and toe of pit walls however, the Standard Operating Procedure (SOP) and Job Hazard Analysis (JHA) reviewed contained only limited documentation of this restriction.

1 Please develop an appropriate SOP for all persons and equipment working in the pit and where work is required below a face, it must have prior approval from the geotechnical specialist on site.

MHSA article 10. (1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed the SOP and JHA for Milne Inlet's ore stockpile sample and survey work did not clearly articulated Golder's recommendations and warnings concerning working on and excavating stockpile slopes.

2 Please reviewed the SOP and JHA and ensure the recommendations made by Golder, are clearly articulated in the documents.

Promote workplace safety and care for injured workers

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSA article 10. (1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

An angle of repose stockpile is only marginally stable, as soon as the toe of the stockpile is excavated the stockpile angle increases and it becomes potentially unstable. As such, no foot traffic should be allowed on a stockpile face once extraction has commenced (even if extraction is no longer occurring). Buried ice and snow also create potentially unstable conditions and no foot traffic should be allowed on stockpiles faces with buried snow or ice that have potentially melted.

3 Please develop an SOP for stockpile extraction for when the excavated face become oversteep due to presence of ice or consolidated material and an SOP for surveying the stockpile that includes no foot access on potentially unstable surfaces.

MHSA article 10. (1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed the following deficiencies noted for the Milne Inlet Quarry:- 1) significant loose on the bench faces, 2) bench width is less than 8m, 3) inadequate berms on the haul roads, and 4) a frozen blast at the south end.

4 Please install berms and post NO-ENTRY signage restricting access to the quarry and perform no work in it until a quarry design compliant with the requirements of the MHSR (e.g Section 1.03 and 1.04) and accepted engineering practice has been approved by WSCC.

MHSR sect 1.03.(1) *The owner of a surface mine or an underground mine shall maintain a mine design, acceptable to the chief inspector, assessing the ground stability of the active and proposed workings of the mine.*

(2) *The mine design that the owner is required to maintain shall be prepared by or under the direction of a professional engineer experienced in ground stability design and shall bear the engineer's seal and signature.*

Date of Report 20160721 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the following deficiencies noted for the QMR2 Quarry: - 1) loose across the bench faces, and 2) bench width is less than 8m.

5 Please install berms and post NO-ENTRY signage restricting access to the quarry and perform no work in it until a quarry design compliant with the requirements of the MHSR (e.g. Section 1.03 and 1.04) and accepted engineering practice has been approved by WSCC.

MHSR sect 1.03.(1) *The owner of a surface mine or an underground mine shall maintain a mine design, acceptable to the chief inspector, assessing the ground stability of the active and proposed workings of the mine.*

(2) *The mine design that the owner is required to maintain shall be prepared by or under the direction of a professional engineer experienced in ground stability design and shall bear the engineer's seal and signature.*

Attn: Fred Bailey P.Eng., Chief Inspector of Mines

Subject: Geotechnical Review of Mary River Project: July 13, 14, 15 2016

Introduction

As requested Michael Cullen Geotechnical Ltd (MCG) completed a geotechnical review of Baffinland Iron Ore Mines Corporation Mary River Project on July 13, 14, 15 2016. The purpose of this inspection was as follows:

1. To assess if the operation is meeting the intent of the Mine Health and Safety Regulation (MHSR) as it applies to geotechnical stability.
2. To review if the operation is following generally accepted engineering practices for geotechnical design, construction, and operation that may affect health and safety.
3. To provide general comment on geotechnical conditions at the mine that may affect health and safety.
4. To provide direction to the Mines Inspectors on geotechnical issues potentially affecting health and safety.

The site review tour included the pit, waste rock dump, Mary River quarries, ore load out dock, ore stock piles, and Milne quarry. The Milne Inlet site review was completed with Daryl Finlay of Baffinland. The Marry River site review was completed with Jeremy Moar, of Baffinland. A close out meeting with Mine Management and OHS personal was held following the inspection.

As part of this review we received and have reviewed the following documents:

- "Guidelines for Working Near Crushed Ore Stockpiles" by Golder Associates dated May 3, 2016.
- "Geotechnical Review of the Updated 5 Year Pit Deposit 1 Open Pit Mary River, Baffinland" by Golder Associates, dated April 17, 2016.
- "Ground Control Management Plan R0" by Baffinland Iron Mines Corporation, December 2015.
- "Baffinland Mary River Open Pit Geotechnical Inspection August 2015" by Golder Associates, dated September 21, 2015.
- Various Standard Operating Procedures and Job Hazard Analysis prepared by Baffinland Iron Mines Corporation.
- "Bench Scale Rockfall Report Letter" by Baffinland Iron Mines, dated June 24, 2016.

Open Pits

The 5-year starter pit is underway with 3 benches: 640, 650 and 660.

Due to uncertainty with geologic structure a somewhat conservative design approach has been adopted for the starter pit: it is less than 100m deep, with an overall slope of 45 degrees, final walls will use 20m high bench faces with a 70 degree face angle, and 13m design width. All final walls will be trim blasted. The configuration of the starter pit is such that there will be opportunity to adjust the configuration as experience and additional knowledge is gained. The experience and knowledge gained in the starter pit will be used to design the final pit.

The design for the starter pit did not include a detailed assessment of bench crest break-back, assessment of the ability of bench to contain the largest expected bench scale failure, or assessment of rockfall capture. The rational for omitting was lack of credible information. We consider that it was acceptable to omit these assessments due to the relatively small pit size, 5 year pit life, conservative design approach taken with adaptable configuration.

The mine is completing routine mapping of geologic structure to verify design assumptions and to project structures into future benches to allow time to modify layout if required. The Mine has engaged Golder Associates to assist with pit design and blast design.

Final pit wall bench faces are to be 20m high (up to 25m on first bench). The upper half of the final pit walls is now exposed on the 660 bench, see Photo 1 and 2. During spring thaw a 200t failure occurred from a section of the final wall. It is understood that this section of the wall appeared to be stable at the time of development. The failure was controlled by the dominate N-S striking structure, see Photo 1. Following the failure, the wall once again appears stable. We suspect that there will be ongoing stability issues with the first bench face once it is taken to final height (10m more than present). It should be noted that very few pits in the NWT and Nunavut attempt to create double benches in the first 30m below surface due the presence of the more fractured and weathered cap rock. The Mine reports that it is implementing the following measures to mitigate stability concerns and the rockfall hazard on the upper final wall:

- Re-scale all exposed walls while still reachable
- Place berms at toe of faces identified as potentially unstable.
- Restrict access to the danger zone at the crest and toe of a bench.
  - We reviewed several SOP and JHA and only found limited documentation of this restriction. We recommend that appropriate SOP be developed for all persons and equipment working in the pit.
- Require that work below faces be approved by technical services.
  - We reviewed several SOP and did not find this to be documented as a standard operating procedure. We recommend that appropriate SOP be developed.
- Regular inspections by shift boss and technical services.
- Maintain bench access to allow for future scaling and removal of rockfall material if required.
- Ability to reduce height of upper bench by cutting down top.

Internal pit benches are 10m high. The condition of the internal bench faces was observed to vary from good to poor. Faces that break back to the dominant N-S structure often look very good whereas geologic structure and blast damage may both contributed to the poor conditions.

It is understood that blast pattern changes are being made to reduce this damage, especially in the vicinity of final wall crests. Photo 3 shows a typical internal wall on 650 Bench.

Overburden consisting of very fractured rock and residual soil is present across the crest of many of the new benches opened across the hill. It is understood that when frozen the overburden material is fairly competent. Once thawed the material is cohesionless and tends to fail from the crest of the cuts, see Photo 4. The Mine reports that it manages this with the following procedures:

- Pull back unstable overburden material from the crest
- Place berms at toe of faces identified as potentially unstable.
- Restrict access to the danger zone at the crest and toe of a bench.
    - We reviewed several SOP and JHA and only found limited documentation of this restriction. We recommend that appropriate SOP be developed for all persons and equipment working in the pit.
- Require that work below faces be approved by technical services.
    - We reviewed several SOP and did not find this to be documented as a standard operating procedure. We recommend that appropriate SOP be developed.
- Regular inspections by shift boss and technical services.

Based on this review we consider that the starter pit is being designed, constructed and operated in general conformance with the requirements of the Mine Health and Safety Regulation as well as accepted engineering practices. No areas of unmanaged geotechnical concern affecting safety were identified although there is a need to formalize and document standard procedures.

Waste Rock Dump

The waste rock dump currently consists of two 3m lifts: one NAP one PAG, see Photo 5. The dump is being constructed by conventional end dumping. The dump is considered low hazard; it is being constructed on gentle sloping ground and its final height will be ~22m.

Section 1.147 of the MHSR requires that a monitoring and surveillance program be developed. For low hazard dumps the minimum acceptable program would include documented inspections by persons familiar with dump design and stability. It is understood that operations staff complete daily inspections of the dump during dumping operations, and that Technical Services complete weekly inspections.

Based on this review we consider that the waste rock dump is being designed, constructed and operated in general conformance with the requirements of the Mine Health and Safety Regulation as well as accepted engineering practices. No areas of geotechnical concern affecting safety were identified.

Milne Inlet Ore Stockpiles

The temporary ore stockpiles are constructed using either a stacker or loader. The stockpiles will be up to 18m high with angle of repose slopes see Photo 6. The stockpiles are extracted by loader excavation at the toe. It is understood that the stockpiles have performed well to date, with no indications of instability other than shallow movement at surface. It should be noted that this is the first year that full height stockpiles have been developed.

It is understood that the stockpiles need to be sampled and surveyed on a regular basis. Surveying is generally completed by foot traverses over the stockpiles. Golder Associates reviewed stockpile stability and provided appropriate direction and warnings concerning working on and excavating stockpile slopes. We reviewed several SOP and JHA and did not find that Golder's recommendations were articulated in these documents.

An angle of repose stockpile is only marginally stable, as soon as the toe of the stockpile is excavated the stockpile angle increases and it becomes potentially unstable. As such, no foot traffic should be allowed on a stockpile face once extraction has commenced (even if extraction is no longer occurring). Buried ice and snow also create potentially unstable conditions and no foot traffic should be allowed on stockpiles faces with buried snow or ice that have potentially melted. Alternate means of surveying should be used in these situations (e.g. drone, reflector-less EDM).

Based on this review we consider that the stockpiles are being designed, constructed and operated in general conformance with the requirements of the Mine Health and Safety Regulation and accepted engineering practices. An appropriate SOP and JHA has been developed for sampling around the stockpiles. A SOP should be developed for surveying that includes no foot access on potentially unstable stockpile surfaces. A SOP should be developed for stockpile extraction for when the excavation faces become oversteep due to presence of ice or consolidated material.

Milne Inlet Dock

It is understood that a recent deformation survey of the pile foundations showed that piles are performing as per the assumptions and analysis by PND and GeoEngineers. The piles are considered stable.

Sinkholes up to 0.5m deep were noted in the dock fill deck below and on the seaward side of the ship loaders. It is understood that sinkholes up to ~1m deep have occurred in the past. The cause, and significance of these sinkholes is being investigated by the Mine and its consultants. At this time equipment traffic is restricted from using this area and regular visual inspections are being completed.

Quarries

The Milne Inlet Quarry was not operational at the time of this inspection. It is understood that the quarry will be brought back into operation in the near future. The quarry is up to 40m high and consists of 4 bench faces, see Photo 7. The following deficiencies were noted:

- There is significant loose on the bench faces.
- Bench width is less than 8m, in some cases this appears to be by design rather than due to crest break back.
- There are inadequate berms present on the haul roads.
- A frozen blast is located on the south end.

The quarry should be designed and operated as per the requirements of the MHSR (e.g Section 1.03 and 1.04) and accepted engineering practice. We recommend that no further work be allowed until such time as a mine plan, consistent with the MHSR, is developed and submitted to WSCC. A berm should be placed to restrict access to the quarry.

The QMR2 Quarry was not operational at the time of this inspection. It is understood that the quarry will be brought back into operation in the near future. The quarry is up to 30m high and consists of 3 bench faces that are 8 to 10m high, see Photo 8. The following deficiencies were noted:

- There is loose across the bench faces.
- Bench width is less than 8m, it appears that this is due to crest break back.

The quarry should be designed and operated as per the requirements of the MHSR (e.g Section 1.03 and 1.04) and accepted engineering practice. We recommend that no further work be allowed until such time as a mine plan, consistent with the MHSR, is developed and submitted to WSCC. A berm should be placed to restrict access to the quarry.

The D1Q2 Quarry has just started operation adjacent to KM106 on the haul road. It is understood that the Technical Services group have developed plans for this quarry that are consistent with the requirements of the MHSR.

Compliance with the Mine Health and Safety Regulation

Table 1 lists the relevant ground control requirements of the Mine Health and Safety Regulation. The table provides comment on if the Mine is meeting the intent of the Regulation, and if not what is required. Sections in the Table left blank were not assessed during this review or are not applicable at this time.

Conclusions and Recommendations

Other than some operation concerns around stockpiles, highwalls, and quarries no significant unmanaged worker safety hazards related to geotechnical aspects of design and operation were noted during our site review. For the most part the intent of the Mine Health and Safety Regulation as it relates to ground stability and worker safety is being met at the Mine. The Mine is following the recommendations of their geotechnical engineers and consultants, whose designs are considered to be consistent with accepted engineering practices.

The documentation that we reviewed is considered to be consistent with accepted practices. To be consistent with best practices we recommend that the following be adopted by the Mine:

- In the future any rock fall reports should include a "lessons learned" section to help understand and mitigate the hazard of future events.
- The ground control management plan should include the pit design basis information in an appendix such that it is readily referenced by future designers and regulators.
- The ground control log book should include a system to track concerns and note when ground control issued have been remedied.

When available we request that the following documents be submitted to WSCC.

- 2016 Geotechnical Inspection Review report for the pit.
- Design for the QMR2 quarry consistent with the MHSR
- Design for the QMR1 quarry consistent with the MHSR
- Design for the Milne quarry consistent with the MHSR
- Assessment of the frozen blast at the south end of the Milne quarry
- Assessment of the sinkholes along the ore dock
- SOP for surveying the Milne ore stock piles.
- SOP for stockpile excavation.
- SOP for work being completed around the crest and toe of pit highwalls.

Limitations and Closure

Michael Cullen Geotechnical Ltd. prepared this report for the use of the WSCC. This report is based on a review of select reports and work areas at the Mine, and cannot practically cover the entire mine site. Professional reliance has been used throughout this review. This report provides comments and opinions only, based on limited observations and review of the work of others; it is not intended to be used in engineering design.

Michael Cullen Geotechnical Ltd. does not accept liability for any damages suffered where a third party uses this report, or where it is used for purposes other than intended.

We trust that this report satisfies your present requirements. Should you have any questions or comments, please do not hesitate to contact us.

Sincerely
Michael Cullen Geotechnical Ltd.
Per:

Photo 1: 200 t failure from 15m high final pit wall face on upper bench. Ultimate height will be ~25m

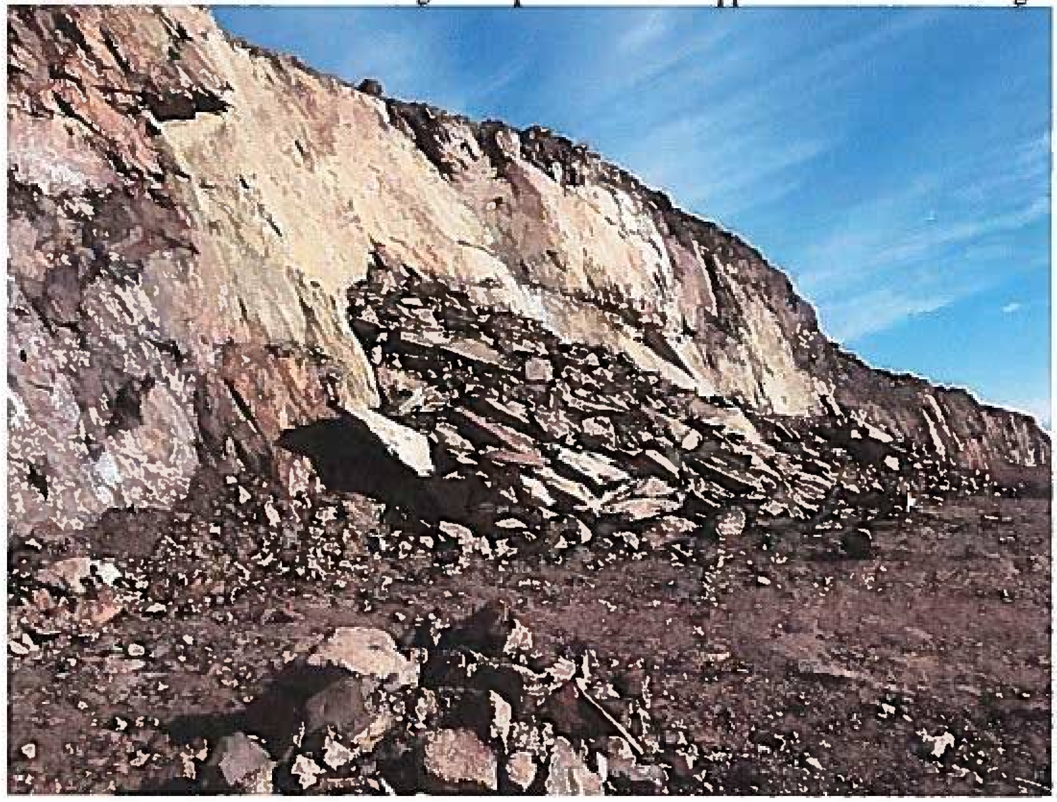

Photo 2: Ongoing raveling from 12m high final pit wall face on upper bench. Ultimate will be ~22m

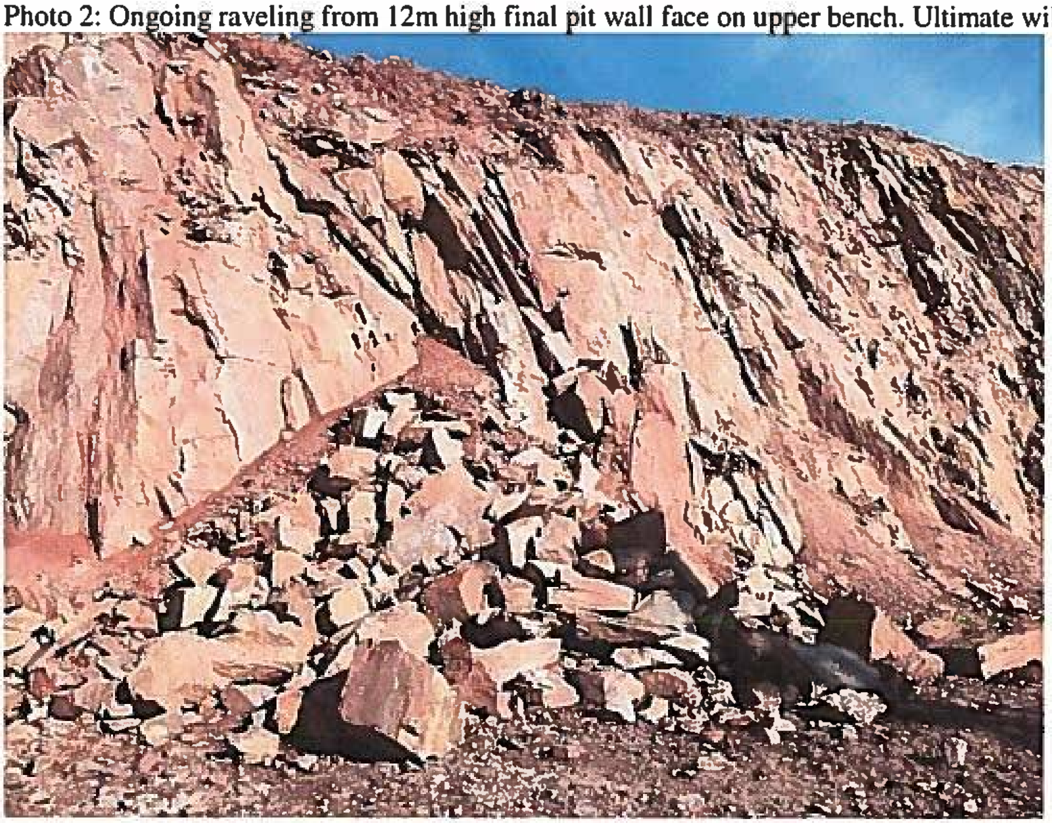

Photo 3: 10m high internal wall on 650 Bench. Geologic structure and blast damage contribute to local instability.

Photo 4: 10m high internal wall on outside edge of 640 Bench. Overburden across top of bench is raveling now that it has thawed.

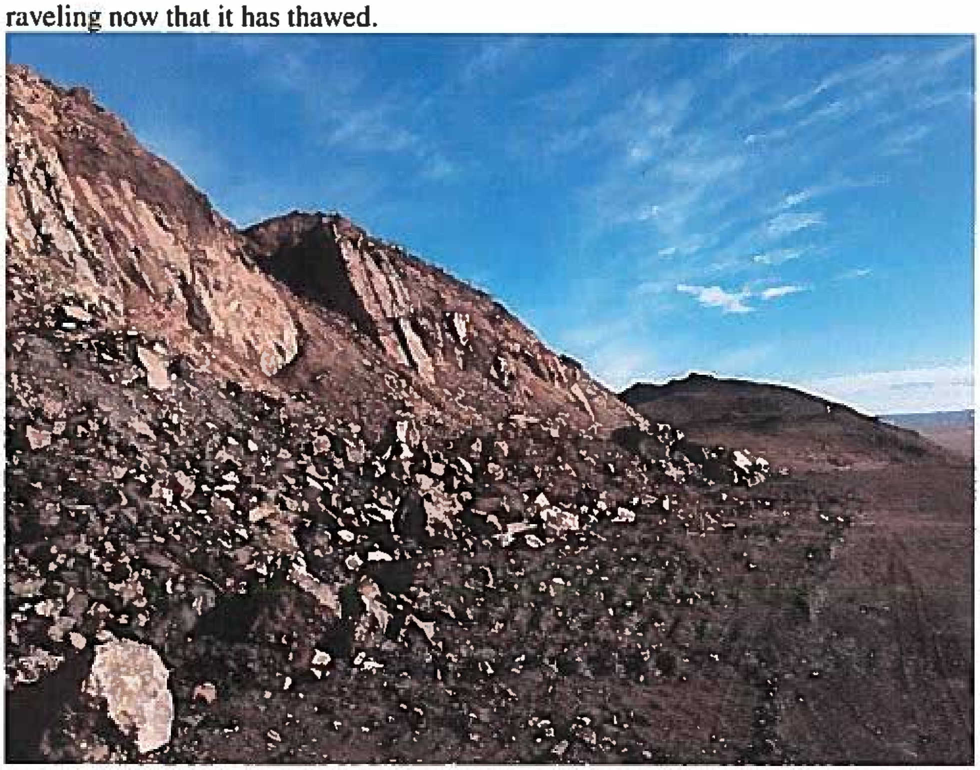

Photo 5: Waste Rock Dump with new sediment pond in background.

Photo 6: 18m high angle of repose stockpile with frost on surface

Photo 7: Milne Quarry. Much loose present of faces and bench width less than 8m

Photo 8: QMR2 Quarry. Much loose present of faces and bench width less than 8m

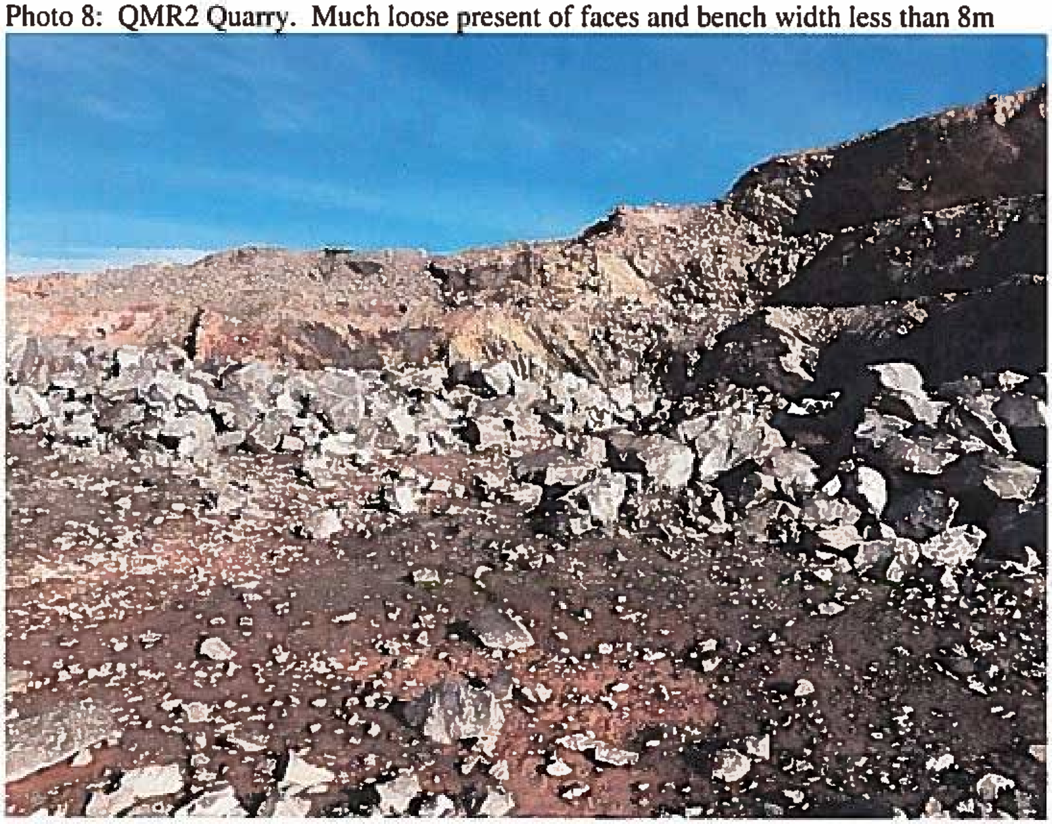

Table 1: Relevant Geotechnical Requirements of the Mine Health and Safety Regulation

Section of Regulation	Comments	Recommended Action
1.03.(1) The owner of a surface mine or an underground mine shall maintain a mine design, acceptable to the chief inspector, assessing the ground stability of the active and proposed workings of the mine. (2) The mine design that the owner is required to maintain shall be prepared by or under the direction of a professional engineer experienced in ground stability design and shall bear the engineer's seal and signature.	Milne Port and QMR2 quarry are not in compliance with regulation	Pit is in conformance with the regulation. No action is required at this time. Mine to submit appropriate design for Milne and QMr2 quarry prior to them being put back into operation.
1.04. The mine design shall consist of drawings, plans, calculations, specifications and written descriptions and shall (a) describe the geology of the mine; (b) outline the geometry of existing excavations, if any, and proposed excavations; (c) provide the rock mass characteristics that are representative of the ore, footwall and hanging wall rock that will be encountered most frequently and identify the orientation of the most common joint sets; (d) describe the hydrological features that may affect the working of the mine; (e) describe previous occurrences of ground instability and include recommendations from reports of investigations; (f) describe, for surface mines, expected climate conditions, the presence of permafrost, if any, and average monthly precipitation; (g) describe the mining method including bench or stope sequencing and blasting methods; (h) specify ground support systems, including pillars, backfill, timber support, tendon support and any other type of support, the criteria used concerning their selection, dimension, spacing and extent; (i) describe measures used and planned to assess potential ground instability; (j) include specific precautions to be taken concerning parts of the mine where bodies of water, overburden, tailings, gas, low oxygen or water soaked material may inrush or flood the workings; and (k) include such other information as the chief inspector may require.	Milne Port and QMR2 quarry are not in compliance with regulation.	Pit is in conformance with the regulation. No action is required at this time. Mine to submit appropriate design for Milne and QMR2 quarry prior to them being put back into operation.
1.05. The mine design shall be assessed and updated by an authorized person annually and before any major change is made to the mining method or the equipment used.		Mine is in conformance with the regulation. No action is required at this time.

Table 1: Relevant Geotechnical Requirements of the Mine Health and Safety Regulation

Section of Regulation	Comments	Recommended Action
1.24. A ground control logbook shall be maintained for surface and underground mines (a) the time, date and location of all tests relating to the requirements of the quality control program for ground support systems specified in section 1.13; (b) if there is any ground movement in the mine, details of the records of the ground monitoring devices in the area affected before the ground movement; (c) details of uncontrolled falls of ground; (d) details of working ground, tension cracks or other signs of instability; (e) details of rockburst and seismic events; (f) damaged supports; and (g) measurements taken from monitoring devices.	Mine has implemented a ground control logbook	Mine is in conformance with the regulation. No action is required at this time.
1.26. The shift boss shall convey the information contained in the ground control logbook referred to in the paragraphs 1.24(c) to (f) to every employee, worker and any other person working in the area under the shift boss' supervision before the employee, worker or other person begins working in the area.		Mine is in conformance with the regulation. No action is required at this time.
1.27. The ground control logbook shall be read and signed each day by the shift boss and by the mine engineer designated by the manager.		Mine is in conformance with the regulation. No action is required at this time.
1.135. All trees and other vegetation, clay, earth, sand, gravel, loose rock or other unconsolidated material lying within 2 m of the rim of a working face or wall in a surface mine shall be removed and beyond this distance all unconsolidated material shall be sloped to an angle less than the natural angle of repose.		Mine is in conformance with the regulation. No action is required at this time.
1.136. (1) No work shall be conducted at or below a face or wall of a surface mine until that face or wall has been examined and declared safe by the shift boss. (2) Nothing in subsection (1) shall prevent the shift boss from being accompanied by other persons who may be required to make the face or wall safe.		Mine is in conformance with the regulation.
1.137. (1) Where a surface mine is worked in benches, (a) each catchment berm shall be designed so that its final width will not be less than 8 m; and (b) loose rock shall not be allowed to accumulate on a bench or catchment berm in a manner that endangers any person working on a lower bench. (2) The manager shall, in consultation with the Committee, develop a procedure acceptable to the chief inspector that provides for the safety of workers should loose rock accumulate on a catchment berm and access to clean it not be possible.	Milne Port and QMR2 quarry are not in compliance with regulation	Pit is in conformance with the regulation. No action is required at this time. Mine to submit appropriate design for Milne and QMR2 quarry prior to them being put back into operation.

Table 1: Relevant Geotechnical Requirements of the Mine Health and Safety Regulation

Section of Regulation	Comments	Recommended Action
1.138. No person shall allow any part of a face or wall of a surface mine to overhang.		Mine is in conformance with the regulation. No action is required at this time.
1.139. At a surface mine where unconsolidated material is being worked or removed and could collapse onto the loading equipment, the vertical face shall not be higher than the reach of the loading equipment.		Mine is in conformance with the regulation. No action is required at this time.
1.140. Except where the working face is sloped at an angle acceptable to the chief inspector, the height of the working face shall not be more than 2 m higher than the reach of the loading equipment.		Mine is in conformance with the regulation. No action is required at this time.
1.141. Sections 1.139 and 1.140 do not apply (a) where material is removed by backhoe, excavator, dragline or similar equipment operating from above the face that it is excavating; or (b) where a multiple bench system of mining is being carried on in accordance with conditions approved by the chief inspector.		Mine is in conformance with the regulation. No action is required at this time.
1.147. The manager shall implement and maintain a surveillance and instrumentation program recommended in a waste dump design approved by the chief inspector.	WRD is inspected daily by shift boss and weekly by Technical Services	Mine is in conformance with the regulation. No action is required at this time.
1.150. A dump shall be designed by a professional engineer where required by the chief inspector or where it has one or more of the following characteristics: (a) a planned volume that exceeds one million cubic m; (b) a height of dump in excess of 50 m; (c) an area to be covered by the dump exceeding 5 ha; (d) it is founded upon natural or trimmed slopes which are sometimes steeper than 20 from a horizontal plane; (e) where waste material is dumped or placed in a water course having a potential peak flow greater than 1 cubic m per second, once in every 200 years, (f) it is situated in such a way that it may be a potential menace to a building, a road, a domicile, a prominent power transmission line, a pipeline or a major water course.	The WRD is considered low hazard.	Mine is in conformance with the regulation. No action is required at this time.

Table 1: Relevant Geotechnical Requirements of the Mine Health and Safety Regulation

Section of Regulation	Comments	Recommended Action
1.161. (1) The manager shall prepare procedures for the examination of open pit workings including (a) accumulations of loose rock on catchment berms which may endanger persons working below; (b) the height of working face in relation to reach of machine digging it; (d) the condition of roads to working area; (h) the presence of overhangs, face slips and faults in the face. (2) The manager shall prepare procedures for the examination of waste rock dumps including (a) irregularities noted in the dump platform; (b) the adequacy of mixing of rock being dumped; (c) the drainage and water problems; (d) any over-steepening in dump face; (e) the adequacy of berms; (g) the gradient of dump platform; and (h) any safety concerns beyond the toe of the dump. (3) The manager shall prepare procedures for the examination of tailings ponds including (a) the condition of the face of the embankment; (b) signs of seepage; (c) sloughing; (d) the condition of beach; (e) the width of top of embankment; and (f) the depth of water.	Regular inspections are made by shift boss and Technical Services. Yearly inspections completed by consultant (Golder Associates). Mine indicates that procedures are in place for work around crest and toe of pit walls however documented SOP could not be located. Mine indicates that procedures are in place for excavation of stockpiles, however documented SOP could not be located. Mine indicates that procedures are in place for foot traffic on stockpiles, however current SOP do not cover all situations.	Mine is in conformance with the regulation. Mine to develop and submit SOP for work around toes and crest of pit walls. Mine to develop and submit SOP for foot traffic on stockpiles Mine to develop and submit SOP for excavation of stockpiles

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

20160721 – GEOTECHNICAL INSPECTION

September 03, 2016

Martin van Rooy
WSCC Mines Inspector
Iqaluit, Nunavut

Dear Mr. van Rooy:

Further to 20160721 Mary River project electrical and geotechnical inspection reports, please see our response to your inspection.

Best Regards,
Bikash Paul
General Manager

GEOTECHNICAL INSPECTION:

Noticed the mine has restricted access to the danger zone at the crest and toe of pit walls however, the Standard Operating Procedure (SOP) and Job Hazard Analysis (JHA) reviewed contained only limited documentation of this restriction.

1 Please develop an appropriate SOP for all persons and equipment working in the pit and where work is required below a face, it must have prior approval from the geotechnical specialist on site.

RESPONSE:

In progress. Expected completion date: September 30, 2016.

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the SOP and JHA for Milne Inlet's ore stockpile sample and survey work did not clearly articulated Golder's recommendations and warnings concerning working on and excavating stockpile slopes.

2 Please reviewed the SOP and JHA and ensure the recommendations made by Golder, are clearly articulated in the documents.

RESPONSE:

In progress. Expected completion date September 30, 2016

An angle of repose stockpile is only marginally stable, as soon as the toe of the stockpile is excavated the stockpile angle increases and it becomes potentially unstable. As such, no foot traffic should be allowed on a stockpile face once extraction has commenced (even if extraction is no longer occurring). Buried ice and snow also create potentially unstable conditions and no foot traffic should be allowed on stockpiles faces with buried snow or ice that have potentially melted.

3 Please develop an SOP for stockpile extraction for when the excavated face become oversteep due to presence of ice or consolidated material and an SOP for surveying the stockpile that includes no foot access on potentially unstable surfaces.

RESPONSE:

In progress. Expected completion date September 30, 2016

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the following deficiencies noted for the Milne Inlet Quarry:- 1) significant loose on the bench faces, 2) bench width is less than 8m, 3) inadequate berms on the haul roads, and 4) a frozen blast at the south end.

4 Please install berms and post NO-ENTRY signage restricting access to the quarry and perform no work in it until a quarry design compliant with the requirements of the MHSR (e.g Section 1.03 and 1.04) and accepted engineering practice has been approved by WSCC.

RESPONSE:

Berm is installed at the Milne Quarry. August 17, 2016

In progress. Expected completion date November 30, 2016

Noticed the following deficiencies noted for the QMR2 Quarry: - 1) loose across the bench faces, and 2) bench width is less than 8m.

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

5 Please install berms and post NO-ENTRY signage restricting access to the quarry and perform no work in it until a quarry design compliant with the requirements of the MHSR (e.g. Section 1.03 and 1.04) and accepted engineering practice has been approved by WSCC.

RESPONSE:

Berm is installed at QMR2. Installed August 15, 2016

In progress. Expected completion date November 30, 2016.

WSCC Workers' Safety & Compensation Commission | ᐃᖃᓇᐃᔭᖅᑎᓄᑦ ᐊᑦᑕᓇᖅᑐᓂᒃ ᐊᒻᒪ ᓇᓪᓕᐅᑕᒪᓂᒃ ᖃᐅᔨᓴᖅᑎᑦ

Sylvain Proulx
Chief Operating Officer
Baffinland Iron Mines Corporation
2275 Upper Middle Road East - Suite 300
Oakville ON L6H 0C3

Dear Mr. Proulx:

Further to the **Mine Health and Safety Act article 26** attached is the 20160922 Mary River project inspection report.

As per **MHSA article**

28. Please post a copy of this inspection report in a conspicuous location, and

29. Advise the chief inspector within 30 days of the remedial measures taken and the remedial measures still to be taken in respect of the inspection report.

32.(1) A person who is adversely affected by a decision or order issued by an inspector may appeal the decision or order, in writing, to the chief inspector within 30 days after its issue.

The WSCC is committed to service excellence. If you have any questions or concerns about this inspection report, please feel free to contact my supervisor Fred Bailey or myself. His phone number is 867 669 4430 or email fred.bailey@wscc.nt.ca.

Sincerely
Workers' Safety and Compensation Commission of the NWT and NU Mine Safety

Martin van Rooy
Engineer/Mines Inspector

WSCC Workers' Safety & Compensation Commission | ᐃᖅᑲᓇᐃᔭᖅᑎᓄᑦ ᐊᑦᑕᓇᖅᑐᓂᒃ ᐊᒻᒪ ᓇᓪᓚᐅᒃᑯᒫᓂᒃ ᖃᐅᔨᓴᖅᑎᑦ

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Mine:	Mary River project	Location:	~950 km NW of Iqaluit		
Operator:	Baffinland Iron Mines Corp.	Lat.	71-19'N	Long.	79-24'W
Manager:	Sylvain Proulx	Inspection Date:		20160907 to 14	
Address	2275 Upper Middle Road East - Suite 300 Oakville ON L6H 0C3				

Martin van Rooy, WSCC's engineer/mine inspector, conducted a general safety inspection of Baffinland's Milne Inlet and Mary River sites.

Robert Bateman, Steven Campbell, Yvan Deslauriers, Denis Doucet, Mark Ebenal, Darryl Finlay, Jean Gauthier, Adam Gyorffy, Matthew Johnson, Brian Larson, Josh Manning, Kenneth Mullen, Edwin Patten, Justin Prosser, Robert Shea, Anthony Stewart, Matthew Tracey and Dale Wales assisted Martin van Rooy for parts of this inspection

Noticed at the Milne ore stockpile, a man, after contacting the 988-loader operator, walked through the loader's work area. The Loader operator continued loading ore from the stockpile and dumping it into the reclaim feed conveyor hopper while the man was walking through his area. The man, a Levert employee, advised he was aware of Baffinland's operating procedure requiring the loader operator to place the bucket on the ground while he was in the loader's work area.

1 Please ensure loader operators and persons working near loaders are trained and comply with Baffinland's procedure that the loader is parked with the bucket on the ground before a person enters the loader's work area and the bucket remains on the ground while the person is in the loader's work area.

   MHSA article 10. (1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed three 988 loaders working on reclaiming ore feeding reclaim conveyor hoppers at Milne however, these loaders have no visible number on the equipment to identify the operator, before entering his work area.

Date of Report 20160922 **Inspector** ____________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

2 Please note this is a repeat infraction see inspection report 29 January 2016. Please ensure a loader's identification is clearly visible during day and nighttime operation.

MHSA article 10. (1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed the operator of articulating truck ART 008, leave the ore stockpile area at Milne where the loaders are working and travel on the ore stockpile haul road however, he did not switched his radio to the MTAC channel as required for this area, from the drill and blast (ship loading) channel he was using.

3 Please ensure the boundary between the loader work area and the ore haul road area at Milne's ore stockpile pad, is clearly marked with barricades and signage stating the radio channel to use to permit direct communication with the people in the same work area.

MHSA article 10. (1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed one of the three 988 loaders at the ore pad at Milne and a number of articulating trucks travelling on the Tote road and working at Mary River, are missing either one or both wheel chocks

4 Please ensure rubber tired mobile equipment is equipped with two wheel chocks and the operator, before leaving their equipment in a parked position, blocks one of the unit's wheels with wheel chocks, to prevent unintended movement.

MHSR sect 10.29.(1) *All rubber tired mobile equipment having a gross weight exceeding 7,000 kg and any other piece of equipment specified by the chief inspector, shall have a minimum of two wheel chocks that shall be used when the operator leaves the equipment in a stationary position.*

Noticed an open bottom transformer installed on a wooden base, at the ship loader office. The transformer has no external ground conductor to show it is grounded.

Date of Report 2016 09 22 **Inspector** ____________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

5 Please place a steel plate below the transformer and install an external ground conductor from XO on the transformer to the generator's ground system.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed a number of electrical cabinets are missing their maximum voltage warning sign i.e. outside the ship loader's office, ship loader 2351-SL-002-CP04, SL002 JB024, 2351-ER-04-DP05, ship loader 1 and 2 construction power supply, Fountain tire shop, panel in seacan next to building #01...

6 Please note this is a repeat infraction see inspection reports 20 July 2016, 12 October 2015... ensure electrical panels installed at Milne Inlet, Tote Road and Mary River are equipped with clear signs warning of the highest voltage hazard present inside the cabinet.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed there are electric cables lying on the upper floor of ship loader 1 and on 2, at the construction power panel area. Also noticed at the construction power panel of ship loader 1, a cover removed from plug-in outlet and a cable connected directly to the outlet's cables.

7 Please review the construction power installation at ship loader 1 and 2 and either remove it or organise it to prevent damage to the cables and equipment. Remove the cable connected to the outlet's cables and replace the outlet cover.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Date of Report 2016 09 22 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the security guard, stationed at the ship loader office, wearing a ring. He was advised that rings must not be worn, while working on site.

8 Please advise all supervisors to ensure they and the persons working under their supervision, are in compliance with Baffinland's policy regarding no wearing of rings while at work.

MHSR sect 8.15.(1) *Where there is a risk of a person coming into contact with moving parts of machinery or with electrically energized equipment or where the work process is such that a similar hazard exists, the person*
(a) shall wear clothing that fits closely about the body;
(b) shall not wear dangling neckwear, bracelets, wrist-watches, rings or similar articles; and
(c) shall confine cranial and facial hair or wear it at a length which will prevent it from being snagged or caught.

Noticed the nip point pulley guards on the sample tower feed conveyor are not installed.

9 Please install the nip point pulley guards

MHSR sect 10.118.(3) *All accessible head, tail, drive and tension pulleys of a conveyor shall be effectively guarded at their nip points and the guards shall extend for a distance of at least 1 m from the nip point.*

Noticed there are some vertical access ladders that require fall protection, i.e. the two ladders to access the walkway across the reclaim conveyor, the two ladders to access the slewing motors platform in tower 002. Noticed the top of the lower vertical ladder to the slewing motor platform finished below the floor making it difficult to access the level or to access the ladder from the floor.

10 Please ensure vertical ladders more than 5 feet high are equipped with fall protection and that their side rails extend at least one meter above the work level the ladder is servicing.

Date of Report 20160922 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

MHSR sect 1.98. *Except in an underground mine, a ladderway at an angle steeper than 70 to the horizontal shall be fixed in place and be provided with*
(a) platforms at intervals not greater than 7 m;
(b) a safety cage; or
(c) a protective device that, when used, will prevent a worker from falling.

Noticed the access door on some 600 Volt cabinets were not locked providing easy access to 600 Volt terminals, i.e. 2351-SL-002-CP04, SL002 JB004, 2351-ER-04-DP01, 2351-ER-04-DP05 and in ER-04 there is a cover missing from the panel below starter marked 'Capstan SL002 Dock East side'.

11 Please ensure electrical enclosures are locked or bolted and that they require tools or keys to gain access to the live terminals and cover the opening below the starter.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed there are field revisions drawn on the electrical schematic in ship loader room ER-4.

12 Please have these as-built electrical revisions up-dated on the original drawings and certified.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed four men working on a screening plant at the ore stockpile, all men had locked-out and tagged the screen's master switch however, one man had not written his name on the lock-out tag. The person is a contract employee and had not received Baffinland's lockout training.

Date of Report 20160922 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

13 Please note this is a repeat infraction see inspection report 19 May 2016, 20 Dec. 2014... ensure every person on site, authorized to work on equipment, is trained and complies with Baffinland's lockout procedure.

MHSR sect 10.22.(1) *Locks and tags shall be issued to each person who works on machinery or equipment that has to be locked out.*

(2) *Tags issued to individual persons shall contain space for the recording of the person's name, the type of work being performed, the date and time the work was started and the name of the supervisor in charge.*

(3) *Where equipment is to be locked out, each person working on the equipment shall be responsible for affixing his or her own lock and tag to the lock-out device and for removing them on the completion of the work.*

Noticed Baffinland has supplemented its own work force with contract personnel. However, some of these contractors are not complying with Baffinland's work procedures. As noted in
item 1, a man walking through the loader's work area without the loader bucket on the ground and the loader operator not keeping the bucket on the ground while the man was in his work area,
item 3, an operator not switching his radio channel to the new work area, and
item 12, a man not completing his lockout tag information.

14 Please ensure all contract personnel are qualified, trained and comply with all Baffinland's procedures applicable to their work.

MHSA art 15. *Where a contractor performs work at a mine, the contractor, the employee or officer of the contractor in charge of the work of the contractor at the mine and the owner and manager of the mine shall, in respect of the work of the contractor at the mine,*
(a) take every reasonable measure and precaution to protect the health and safety of employees of the contractor, employees of the mine and other persons at the mine; and
(b) comply with, and ensure that other persons comply with, this Act and the regulations and any applicable orders or directives issued under this Act or the regulations.

Date of Report 20160922 **Inspector** ______________________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the cables and hoses were lying indiscriminately among the large jack stands at Milne's mobile maintenance shop, creating a trip hazard.

15 Please note this is a repeat infraction see inspection report 12 Oct 2015, 21... Please ensure no supervisor allows electrical cords, hoses and other items... to lie indiscriminately and without protection over the ground or across a floor where they are a potential trip hazard and or other hazard if un-intentionally cut or damaged.

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed a mechanic working on ore haul truck OHT 24 however, he had not locked out the equipment.

16 Please ensure all persons working with or on equipment are trained in the lockout procedure and apply their individual lock and tag to the lockout system, before working on the equipment.

MHSR sect 10.22.(1) *Locks and tags shall be issued to each person who works on machinery or equipment that has to be locked out.*

(2) *Tags issued to individual persons shall contain space for the recording of the person's name, the type of work being performed, the date and time the work was started and the name of the supervisor in charge.*

(3) *Where equipment is to be locked out, each person working on the equipment shall be responsible for affixing his or her own lock and tag to the lock-out device and for removing them on the completion of the work.*

Date of Report 2016 09 22 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed there is no simple and clear instruction sheet on the wall of the Milne power plant, on the procedure to follow to start-up the power plant and this could be a problem, for an inexperienced operator.

17 Please develop a clear and simple start up instruction sheet for the Milne power plant and for the Mary River power plant and post it in the power plant.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed the fire pump system at Milne had settled further since the May 2016 inspection, increasing the strain on the diesel fire pump exhaust bellows and the fire pumps' piping system. It was also noted that the diesel fire pump had not run since May 2016 because of concerns by the operator, of potential fire line breakage. The operator also advised misalignment between the electric motor and fire pump had damaged the membrane in the electric fire pump's coupling.

On September 10, 2016 at about 6:30 am, instructions were issued to Baffinland to correct without further delay, the Milne fire pump problems. Baffinland advised on September 16, 2016 that the alignment of fire line piping and equipment were completed and the fire pumps were now safe to run without concern of fire line breakage from the settlement.

18 Please review the settlement problems in Milne's water treatment plant and implement a permanent solution, to stop the fire pump system settlement problems.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed extension cords and air hoses lying indiscriminately across the floor of Milne's Fountain Tire shop and there is no clear access to the electrical panel on the wall as it is blocked by a heater hose, a wheel rim and rings.

Date of Report 2016 09 22 **Inspector** ____________

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

19 Please remove the clutter in front of the electrical panel and provide 1-meter clear access to the panel. Remove the extension cords and hoses lying indiscriminately on the floor and provide retractable reels for the hoses and cables for service from above the work area or organize them in orderly manner on the floor with their lines covered

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed Baffinland has received new ore haul trucks and trailers. These units have larger tire diameters than the other ore haul units therefore, the berms along the Tote road must be raised to ¾ the height of the larger tires. Also noticed a berm is required at ~km 10 and the berms at km 34-35, ~42.5 and ~80 are very low. At ~km 57 there is a blind corner and call sign is required to warn oncoming traffic.

20 Please submit a copy of Baffinland's design standard for the Tote road's berms and ensure all sections of the Tote road, where a vehicle could lose control if it went off the road, are bermed to ¾ the height of the largest ore haul tire used on the road. Ensure call signs are installed North and South of blind corners and blind hills.

MHSR sect 1.143.(1) *The manager shall ensure that surface haulage roads are designed, constructed and maintained to provide*
(a) a travel width where dual lane traffic exists, of not less than three times, or where single lane traffic exists, of not less than two times the width of the widest haulage vehicle used on the road; and
(b) a shoulder barrier
(i) at least 3/4 the height of the largest tire on any vehicle using the road,
(ii) of a construction or a specification that is acceptable to the chief inspector

Noticed the Winterhaven water pumphouse at Mary River needs a clean-up

Date of Report 2016 09 22 **Inspector** ______

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

21 Please clean-up the Winterhaven pump house.

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed in the helicopter garage, a stack of pickets are placed in front of the fire extinguisher, the terminals of a storage battery are uncovered and there is an electrical panel with no maximum voltage warning sign and with an open hole in the bottom of the panel.

22 Please ensure clear and unobstructed access is maintained to fire extinguishers, cover the storage battery terminals, plug the electrical cabinet's open hole and affix a maximum voltage sign to it.

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed the extension cords used to power the Herman Nelson heaters in Nuna workshop and in the Mary River warehouse.

23 Please provide an outlet at each heater and plug the heater directly into the outlet. Remove the extension cords.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Date of Report 20160922 **Inspector** [signature]

WSCC Workers' Safety & Compensation Commission | ᐃᖃᓇᐃᓯᖅᑎᓄᑦ ᐊᑦᑕᓇᖅᑐᓂᒃ ᐊᒻᒪ ᓇᓪᓕᐅᒃᑯᒪᓂᒃ ᖃᐅᔨᓴᖅᑎᑦ

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the switches in the electrical panel in Mary River's service garage dry, have no labels plus there is an open slot in the panel and it is missing its maximum voltage sign.

24 Please label the circuit the switch services, cover the open slot and affix a maximum voltage sign

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines.*

Noticed the 16" x 1¾" reinforcing of the 8" x 8" main roof beam of Mary River electrical shop, is not installed continuous between the columns as per the design drawings thereby not achieving the designed beam strength required.

25 Please consult with the design engineer and have him submit a certified drawing showing how to correct the construction error.

MHSR sect 10.01.(1) *All mechanical equipment used at mines shall be*
(a) designed in accordance with good engineering practice;
(b) constructed in accordance with a design and plans that have been certified by a professional engineer; and
(c) acceptable to the chief inspector.

Noticed the hammer and drill bits for the Caterpillar MD6290 drill, are stored in the bit grinding shop at Mary River. The hammer weighs approximately 230-pound and the drill bits about 50-pounds and these are manually hauled from inside the shop onto a truck and then onto the drill. This manual manipulation of the hammer and or drill bits is of concern because of the heavy weights involved in this awkward installation work.

Date of Report 2016 09 22 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

26 Please review the complete bit and hammer handling cycle, to/from the storage, to/from the drill, to/from the bit grinding shop, other... to ensure effective protection is provided for any person exposed to the risk of injury from manually handling this equipment. In addition, ensure each person engaged in the bit and hammer handling cycle, receives routine training in manual lifting procedure(s).

MHSR sect 9.72.(1) *The manager shall ensure that suitable mechanical equipment is provided and used for the handling of heavy or awkward loads.*

(2) *Where the use of mechanical equipment is not practicable, the manager shall take all practical means to adapt heavy or awkward loads to facilitate lifting, holding or transporting by employees or to otherwise minimize the manual handling required.*

Noticed the materials stored in the electrical room of the bit grinding shop, blocked ready access to the electrical equipment in the room.

27 Please remove the stored material and maintain at least one-meter clear working space about the electrical equipment.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines*

Noticed the long extension cords used at crushing and screening plants 'A', 'B' and 'C'.

28 Please provide convenient outlets in and around the areas where the extension cords are used, plug the equipment directly into the outlet and remove the long extension cords.

MHSR sect 13.01.(2) *Except where otherwise required by these regulations, the electrical system and electrical equipment shall meet or exceed the requirements of CSA Standard CAN/CSA-M421-93, Use of Electricity in Mines*

Date of Report 2016 09 22 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

Noticed the open cardboard containers stored on the floor in Mary River's mobile maintenance shop warehouse, are a potential fire hazard.

29 Please remove the cardboard containers and other combustible products and minimize the potential fire hazard in this area.

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed the small propane torch gas bottles are stored in a 45-gallon drum in Mary River's mobile maintenance shop. This is a concern, as the propane from a leaking bottle would accumulate in the 45-gallon drum awaiting ignition. The shop supervisor was advised to move the 45-gallon drum outside and provide vent holes in the bottom of the drum to prevent propane accumulation.

30 Please ensure empty or full propane cylinders/bottles when not in use, are stored outside in a well-ventilated area

MHSR sect 10.101.(1) *All gas fired appliances, equipment and pipelines shall be installed and maintained in accordance with the standard CAN/CGA-B149.1-M95, Natural Gas Installation Code and CAN/CGA-B149.2-M95, Propane Installation Code, and the system shall comply with the requirements of the Gas Protection Act and the regulations under that Act.*

Noticed a new crane is replacing the crane on the back of service truck parked in the mobile maintenance shop however, the replacement crane is not an exact duplicate of the old crane.

31 Please ensure a professional engineer certifies the replacement crane and replaces the load chart and

Date of Report 2016 09 22 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

crane decals on the truck for the existing crane with the new crane's data.

MHSR sect 10.128.(2) *A new or used crane, shovel, dragline, boom truck or similar type of equipment that uses a rope or cable to raise, lower or swing a load or materials during its work cycle shall not be put into service unless*
(a) a certificate has been obtained from the manufacturer or from a professional engineer competent in the design of hoisting equipment, certifying
(i) the maximum load capacity and maximum operating speed of the hoisting or lifting system, and
(ii) that all critical load-bearing components of the complete assembly and accessories have been inspected and non-destructively tested; and
(b) all the commissioning tests have been successfully completed.

Noticed there are extension cords and air hoses lying indiscriminately across the floor at Fountain Tire's work area in the mobile maintenance shop.

32 Please remove the extension cords and hoses lying indiscriminately on the floor and provide retractable reels for the hoses and cables for service from above the work area or organize them in orderly manner on the floor with their lines covered

MHSR sect 9.04. *The manager shall develop and implement an effective housekeeping program to ensure that*
(a) all worksites and travelways are maintained in a safe condition;
(b) materials and equipment are stored in a manner so as not to endanger persons; and
(c) appropriate action is taken whenever necessary to maintain a hazard-free environment.

Noticed ore haul truck OHT 29 cab is equipped with a high-pressure air hose with a blowgun attached for cleaning. There is no sign in the cab warning of the hazard of using compressed air for cleaning and the PPE required while using high-pressure air for cleaning. A high-pressure air blowgun was also removed from a Baffinland toolbox in the mobile equipment service garage.

33 Please note this is a repeat infraction see inspection report 29 Jan 2016. Please direct all supervisors

Date of Report 20160922 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

to remove high-pressure air blowguns from service including the ore haul trucks and as previously noted review the practice of using compressed air for cleaning and where this procedure is required, ensure-

a) a safe work procedure is developed that addresses without limiting, personal protective equipment, hearing protection, maximum air pressure to the blowgun, barricades around the work area...

b) people, authorized to use high-pressure air for cleaning, are trained in this safe work procedure,

c) submit a copy of the safe work procedure for using high-pressure air for cleaning, and

d) identify the areas where an ***authorized person*** may use high-pressure air for cleaning.

MHSR sect 10.121.(1) *The manager shall identify and supply all suitable personal protective equipment to be worn by the operator for the safe operation of all miscellaneous tools including grinders, chain saws, pneumatic tools and all power activated tools.*

(2) *No person shall use any miscellaneous tool unless*

(a) the person is trained and authorized to use the tool;

(b) the person is wearing, and has received training on, the proper personal protective equipment required for the safe operation of the equipment; and

(c) the personal protective equipment is in good condition.

Noticed ore haul truck OHT 12 was allowed to run in the mobile maintenance shop for some time to build-up brake line air pressure however, the engine's exhaust is not ducted out of the building causing exhaust fumes to build up in the shop.

34 Please review alternate means of charging-up the ore haul truck's brake line air pressure such as plant compressed air, to avoid discharging the truck's engine exhaust into the shop.

MHSR sect 10.59.(2) *The exhaust of an internal combustion engine that is temporarily or permanently operating within a building on the surface shall be conducted to a point outside the building and prevented from*

(a) re-entering the building;

(b) entering the intake of any compressor;

Date of Report 2016 09 22 **Inspector** [signature]

REPORT OF AN INSPECTOR OF MINES

Issued pursuant to Section 26(2) of the *Mine Health and Safety Act*

(c) contaminating the atmosphere of another building; or
(d) contaminating mine workings.

Noticed in the various shops at Milne and Mary River, hoses, welding cable and extension cords are placed on the floor for work reasons however, on the floor these items become trip hazards and are damaged or cut by men or equipment traveling over them or material falling on them.

35 Please ensure hoses, cables, extension cords... are placed in an organized manner on the floor of the shop and are covered to minimize the trip hazard and protect them from damage alternatively where feasible us vertical drop lines to avoid placing them on the floor.

MHSA art 10.(1) *The manager shall take every reasonable measure and precaution to protect the health and safety of employees and other persons at a mine.*

Noticed the panic bar on the exit door of the Mary River welding shop is still broken making it difficult to open the exit door however, this was noted as repaired in Baffinland's response of April 20, 2016 to item 21 of inspection report 20160129.

36 Please repair the Mary River welding shop exit door panic bar.

MHSR sect 1.159.(1) *The manager shall prepare a procedure for the examination of worksites that provides for examination*
(i) of the emergency arrangements including safe means of egress;

Noticed an open slot in electrical panel 4521.3 PNL 002A in the Mary River welding shop.

37 Please cover the open slot in the electrical panel

Martin van Rooy
Engineer/Mines Inspector
WSCC
Iqaluit, Nunavut

Dear Mr. van Rooy:

Further to your letter of outstanding government orders, please see responses for completed orders in this letter.

Robert Gagne
General Manager

1. Order # 20160129-10 cleaning with compressed air is not allowed at Bim - complete.
2. Order #20160129 – 16 A new tank with a fuseable link has been installed – complete
3. Order #20160921 – 19 the fountain tire shop has been cleaned up and material removed from in front of the electrical panel – complete
4. Order #20160921 – 29 The cardboard containers and other combustible products have been removed – complete
5. Order #20160921 – 32 The extension cords and air hoses have been removed and are stored neatly – complete
6. Order #20160921 – 33 All of the OHTs have been checked and the air hoses removed from each unit – complete
7. Order #20160921 – 34 All air tanks are retrofitted to use shop compressed air rather than run the truck – complete
8. Order #20160921 – 35 All hoses, cables and extension cords are picked up and stored neatly – complete
9. Order #20160921 – 30 The drum of small propane bottles has been moved outside and vented – complete
10. Order #20160129 – 13 the single line schematics are posted in the electrical rooms and will be updated whenever there are changes – complete
11. Order #20160519 – 21 The hotsy has been checked and verified to be compliant – complete
12. Order #20160721 – 01 – a single line diagram has been posted on the wall of Milne power house B – complete
13. Order #20160721 – 08 the enclosure is repaired which allows to the door to be closed – complete
14. Order #20160721 – 09 – Grounding has been installed in accordance with CSA M421-11 clause 4.4.5.2.2 – complete
15. Order #20160721- 10 This is complete on the one on the pad and the spare one will be done before bringing it on operation – complete for the one on the pad
16. Order #20160721 – 11 This unit removed from service – complete
17. Order #20160721 – 12 This unit removed from service – complete
18. Order #20160721 – 15 This is complete
19. Order #20160721 – 16 – this is complete
20. Order #20160721 – 17 Electrical outlets have been installed - complete
21. Order #20160721 – 19 – this is done on the one on the pad and the spare one will be done before bringing it in operation – complete for the one on the pad
22. Order #20160721 – 30

23. Order #20160922 – 21 Weatherhaven pump house has been cleaned up – complete
24. Order #20160922- 22 Items completed
25. Order #20160922 – 23 Outlets have been installed and extension cords removed – complete
26. Order #20160922 – 24 Items completed
27. Order #20160721 – 03 The items have been removed from in front of the electrical panels – complete
28. Order #20160922 – 04 All units have been fitted with two wheel chocks – complete
29. Order #20160519 – 19 Vacuum cleaners are now in each drill – complete
30. Order #20160721 – 06 Complete
31. Order #20160922 – 26 See attached procedure – complete
32. Order #20160721 - 01 See attached SOPs – complete
33. Order #20160721 – 02 See attached SOPs – complete
34. Order #20160721 – 03 See attached SOPs – complete
35. Order #20160721 – 05 No entry signs have been erected and quarry design criteria has been submitted to and approved by WSCC – complete
36. Order#20160922 – 27 Area is cleaned up and material removed from in front of the electrical equipment – complete
37. Order #20160922 – 08 Memo has been issued to all personal that jewelry is not to be worn while at work – complete
38. Order #20160922 – 36 Door has been repaired – complete.
39. Order #20160922 – 11 Complete
40. Order #20160922 – 12 Complete

Re: Follow-up to Spill #16-006, Reported on Jan 6th, 2016
Mary River Project - Water Licence No. 2AM-MRY1325

Summary:

At approximately 07:30 on January 06, 2016, the crusher operator was starting up the equipment on the B-Spread Crusher at the Mine Site Crusher Pad and the belt gave way and broke. This resulted in the belt coming in contact with the lube oil return line on the Tertiary cone, causing the line to release lube oil to the adjacent area. The volume of the spill was approximately 120L covering an approximate area of 4 m^2. The spill location is > 100 m from the nearest drainage (non-fisheries habitat) and all water bodies are currently frozen.

Immediate and Follow-Up Action:

The Crusher Supervisor and Environment Department were notified immediately upon spill discovery. The lube oil was contained and cleaned up with spill pads and the contaminated material was placed in Quatrex bags. The contaminated material from the impacted area was removed for disposal in the Landfarm Facility at Milne Port.

Recommendations:

The belt broke due to a catastrophic failure. Preventative maintenance and inspection programs for the various components of the crusher are in the process of being fully implemented.

Current Status:

The Crusher lube oil return line was repaired and the crusher is currently operational. The affected area has been cleaned up and the contaminated material disposed of.

Should you require further information or clarification on the above noted spill, please feel free to contact Allan Knight at (647) 253-0596 x6010 or Jim Millard at (902) 403-1337.

Re: Follow-up to Spill #16-056, Reported on Feb 26th, 2016
Mary River Project - Water Licence No. 2AM-MRY1325

Summary:

On February 26, 2016 at 5:30 HRS, a worker discovered that the cube van (truck) had leaked approximately 120 litres of diesel onto the ground underneath the vehicle, affecting an area of approximately 10 m2. Upon further inspection, it was determined that the vehicle's fuel line had become damaged and had leaked the contents of the vehicle's fuel tank onto the ground. The location of the spill was greater than 200 meters away from the nearest water body, Milne Inlet, which is currently frozen.

Immediate and Follow-Up Action:

The worker immediately placed spill pads underneath the vehicle to absorb any free product and notified the Environment Department and his Supervisor. Contaminated snow and soil were removed and transported to the Milne Port Landfarm Facility for treatment.

Recommendations:

Routine maintenance will continue to be conducted on all onsite mobile equipment. All mobile equipment operators will continue to conduct pre-operation checks every shift to confirm their equipment has no leaks and is in good working order.

Current Status:

The cube van (truck) fuel line has been repaired and is back in operation. The affected area has been cleaned up and the contaminated snow and soil have been taken to the Milne Port Landfarm Facility for treatment.

Should you require further information or clarification on the above noted spill, please feel free to contact Allan Knight at (647) 253-0596 x6010 or Jim Millard at (902) 403-1337.

Re: Follow-up to Spill #16-063, Reported on March 1st, 2016
Mary River Project - Water Licence No. 2AM-MRY1325

Summary:

At approximately 02:00 on March 01, 2016, the crusher operator for A-Spread noticed a spill under the cone crusher. A lubricant hose came lose and discharged a volume of lube oil onto the crusher pad surface. The operator shut down the crusher immediately and initiated notification and clean-up measures. The volume of the spill was approximately 300L covering an approximate area of 5 m^2. The spill location is > 100 m from the nearest drainage (non-fisheries habitat) and all water bodies are currently frozen and ice covered.

Immediate and Follow-Up Action:

The Crusher Supervisor and Environment Department were notified immediately upon spill discovery. The lube oil was contained and cleaned up with spill pads. The spill area was then excavated and the contaminated material was placed in Quatrex bags. The contaminated material from the impacted area was removed for disposal in the Landfarm Facility at Milne Port.

Recommendations:

Preventative maintenance inspection programs for the various components of the crusher are in the process of being fully implemented.

Current Status:

The lubricant oil hose was tightened and clamps replaced. Crusher A is currently operational. The affected area has been cleaned up and the contaminated material disposed of.

Should you require further information or clarification on the above noted spill, please feel free to contact Allan Knight at (647) 253-0596 x6016 or Jim Millard at (902) 403-1337.

Re: Follow-up to Spill #16-065, Reported on March 3, 2016
Mary River Project - Water Licence No. 2AM-MRY1325

Summary:

On March 3, 2016 at approximately 13:00, while completing routine daily inspections of sewer lines and lift stations a release of grey water was discovered at lift station 19, located between the office and kitchen complexes of the Mine Site Complex. Upon further investigation, the lift station float switch had malfunctioned, causing an overflow which resulted in 100 Litres of grey water to slowly leak onto the adjacent ground surface. An area of approximately $10m^2$ was impacted. The location of the spill was on the Mine Site camp pad, is greater than 100 meters from the nearest watercourse and all water bodies are currently frozen and ice covered.

Immediate and Follow-Up Action:

Fixed Plant Maintenance and the Environment Department were immediately notified. The vacuum truck was used to empty the lift station and remove any pooling grey water. The pumps were shut off and the float was system was replaced.

Recommendations:

Routine inspections of the sewage lines and lift stations will continue to be completed to ensure all components of the sewage system are functioning as designed.

Current Status:

The lift station float switch was replaced shortly after the spill was reported and the lift station is back in service and functioning properly.

Should you require further information or clarification on the above noted spill, please feel free to contact Allan Knight at (647) 253-0596 x6010 or Jim Millard at (902) 403-1337.
